May 2018*

**ATLAS™**  
**CYLINDERS**

Abrasives particulate can cause significant wear to precision components when it enters the cylinder and migrates into the hydraulic system. The Atlas Crown Wiper is extremely effective in keeping contamination out of the cylinder to prevent it from shortening the actuator and system service life. Atlas showcases its commitment to reducing hydraulic system problems with the Crown Wiper. This innovative solution goes a long way toward improving equipment operation, lowering costs, extending component life and machine availability.

## Product Features:

- The sharp leading edge cleans the piston rod on the retract stroke.
- The Crown Wiper acts as a secondary seal by wiping away any oil film adhering to it on the extended stroke.
- Durable polyurethane material works well for both Seal Class 1 and 4 Service.
- Available in fluorocarbon material for Class 5 service in elevated temperatures.
- Beveled design sheds abrasive contamination away from the bushing.
- Available in rod diameters 0.625" - 5.500".
- Does not change cylinder mounting dimensions.

In line with our policy of continuing product improvement, specifications and information contained in this catalog are subject to change.

## **Piston Sealing Solutions for the Most Demanding Applications**

### **Piston Seal Technology For The 21st Century**

The new Atlas universal piston seal design addresses the performance balance between low pressure sealability, low friction, extrusion resistance and seal life.

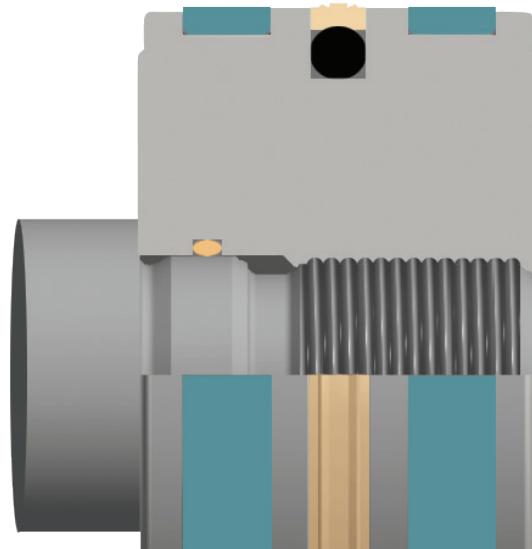

One piston style is used for all piston seal and wear ring configurations and will suit all application requirements. A common piston design permits field changing of seal configuration or seal and wear band material without replacing costly machined components when variations in application parameters occur, such as fluid, temperature or duty cycle.

All piston options include dual non-metallic wear rings to provide maximum stability and bearing area for protection against eccentric loads.

WearGard™ wear rings are internally lubricated for reduced friction and formulated for heavy-duty load-bearing applications.

The standard piston style for Class 1 and 4 service is HP; for 2, 3, 5, 6 and 8 service the standard is KP. If a different piston style is desired for an eligible seal class, enter an 'S' in the Special Modification field of the model number and specify the piston style in text.

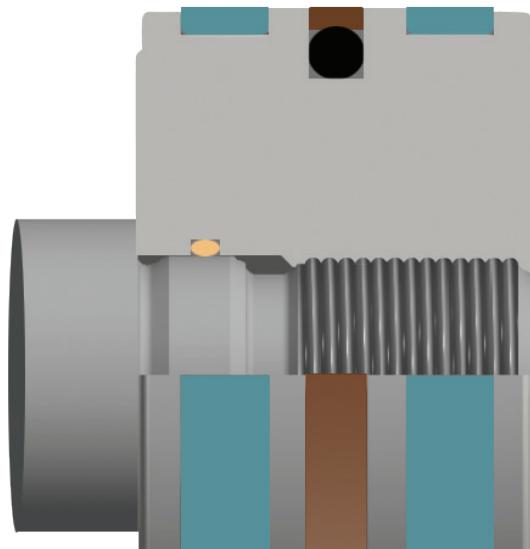

**Atlas HP Polyurethane Piston Seal**

The Atlas HP energized bi-directional piston seal improves upon the low friction and long wear of lipseals by including excellent low pressure sealing performance. Specially formulated polyurethane is long wearing and abrasion resistant with running friction comparable to lipseals. An o-ring energizer ensures virtually zero leakage in low pressure applications. Also, pressure trapping that can result with energized lipseals is not possible with a single energized seal.

The Atlas HP piston seal is an excellent choice for most industrial applications operating with mineral based hydraulic oil and is available in Seal Classes 1 and 4.

**Atlas KP Filled PTFE Piston Seal**

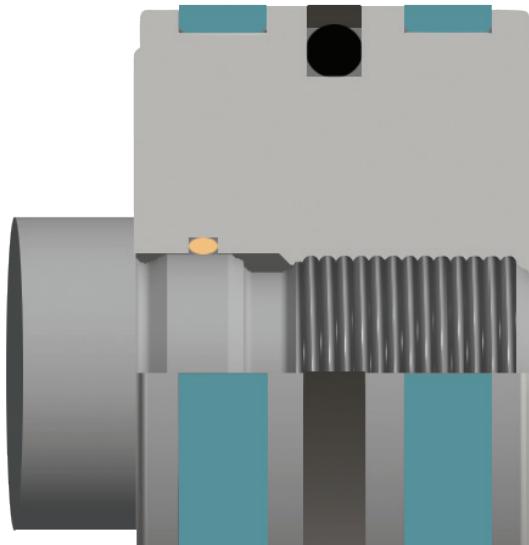

The Atlas KP bronze filled PTFE seal ring material has low running friction for accurate positioning in closed loop servo applications.

When combined with a fluorocarbon energizing ring the Atlas KP seal is rated for 400° F and will increase service intervals in high temperature applications even when compared to fluorocarbon lipseals.

By combining the Atlas KP seal with other energizer o-ring compounds and wear ring materials, the KP seal offers excellent service in all Seal Class environments.

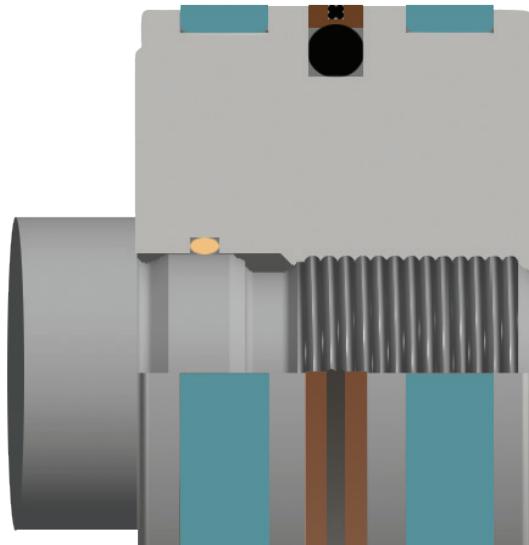

**Selection Guide**

Application Demand	HP Seal	KP Seal	RP Seal	WP Seal
<b>Load Holding</b>	Best	Good	Good	Best
<b>Fluid Compatibility</b>	Good	Best	Better	Better
<b>Heat Resistance</b>	Good (200° F Max.)	Best (400° F Max.)	Better (300° F Max.)	Better (250° F Max.)
<b>Dynamic Friction</b>	Best	Best	Good	Better
<b>Breakaway Friction</b>	Good	Best	Good	Better
<b>Extrusion Resistance</b>	Good	Better	Best	Good
<b>Fluid Isolation</b>	N/A	N/A	N/A	Best

**Atlas RP Thermoplastic Seal**

The Atlas RP step cut ring is made of self-lubricating, glass reinforced, thermoplastic and is o-ring energized. Unlike cast iron rings that bypass oil, the Atlas RP seal provides drift free operation throughout the operating pressure range. This tough seal is fully extrusion resistant, even in the face of extreme pressure spikes, thus ensuring superior wear resistance in the most demanding applications.

Atlas RP can operate up to 300° F and is compatible with Seal Classes 1, 2, 3, 4, 5 and 6.

**Atlas WP Mixed Media Seal**

The Atlas WP Mixed Media seal is designed for applications requiring different media on either side of the piston. This option is ideal when hydraulic oil is on one side of the piston and air is on the opposite side; and it can be equally effective when dissimilar fluids are on either side of the piston.

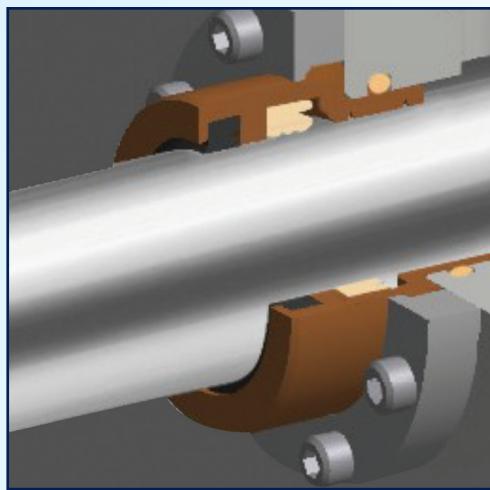

Superior low-friction bi-directional sealing is accomplished by combining an energized filled PTFE seal with a redundant elastomer seal. Energizer and redundant elastomer seal materials are available for compatibility with seal classes 1, 2, 3, 5 and 6. Note: WP piston seal groove is not universal in 1.50" bore.

## **Versatile Piston Rod Sealing Systems Deliver Dry Rod Performance**

Atlas offers the best performing and broadest selection of rod sealing options. Our Tri-lip bolted bushing sealing system is a proven anchor of the offering.

As the rod strokes out, its motion and friction dynamically flex the multi-sealing edges of the Tri-Lip rod seal to maintain their contact with the rod. This provides a cutting action to shear the oil from the rod, allowing the rod to pass out of the rod seal practically dry. Any oil film that remains on the rod is stopped by the inner lip of the Wiperseal and held between it and the rod seal.

On the return stroke any dirt or foreign matter collected on the

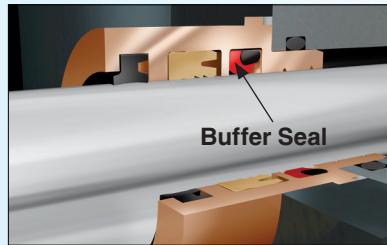

rod is wiped off by the leading edge, or outer lip of the Wiperseal. At the same time, any oil which may be trapped between the Wiperseal and the rod seal is returned into the cylinder. In other words, we have an automatic check valve that prevents any appreciable amount of oil to leak past the seals, and then returns any oil that has managed to wipe by the rod seal.

Tri-Lip bushings are easily removed for service without loosening tie rods and disturbing the pressure envelope. Material options allow compatibility with Seal Classes 1, 2, 3, 4, 5 & 6.

### **Buffer Seal Bushing**

The Atlas Buffer Seal, installed ahead of the primary rod seal, protects the primary seal from the effects of pressure spikes. The result is increased primary rod seal and wiperseal performance life when in severe applications.

The Atlas Buffer Seal is a unique design that allows trapped pressure back into the cylinder. When the rod extends

from the cylinder the Buffer Seal is riding on a high compression sealing point to limit leakage. On the retract stroke the seal rocks forward to allow trapped fluid to pass under the seal and return to the system.

Buffer Seals are available with Seal Classes 1, 2, 4 & 5. To order, enter an 'S' in the Special Modification field of the model number and specify Buffer Seal.

To accommodate the Buffer Seal, rod bushing length is extended 0.31" to 0.81", depending on rod diameter. See Buffer Seal Bushing page 61 for piston rod extension details.

### **Low Friction Bushing**

The Atlas Low Friction Bushing is designed to minimize 'slip-stick' and 'chatter' in servo and 'dither' applications. Two unidirectional bronze filled PTFE primary rod seals and a bronze filled PTFE wiperseal minimize both breakaway and running friction.

Low Friction Rod Seals are available for rod diameters 1.000" - 5.500" in 1.50" - 8.00" bores.

See Piston & Bushing Friction page for comparative seal friction data.

To order, enter an 'S' in the Special Modification field of the model number and specify Low Friction Bushing. Available with Seal Classes 1, 2, 3, 4 ,5, 6 & 8.

## Mounting Styles & Tips for Applying Them

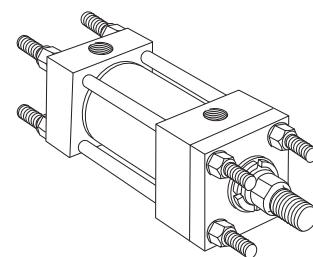

### Extended Tie Rod Mountings – TB, TC, and TD

#### Application:

- Straight line force transfer
- Compression loads (push)
  - use TC or TD
- Tension loads (pull)
  - use TB or TD

#### Advantages:

- Ease of mounting in tight spaces
- Force is transferred along the centerline of the cylinder

**A**  
Overview

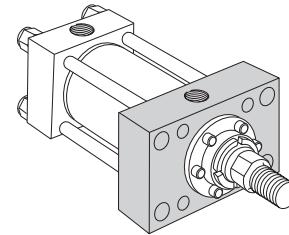

### Flange Mountings – J, JB, JJ, H, HB, and HH

#### Application:

- Straight line force transfer
- Compression loads (push)
  - use H, HB or HH
- Tension loads (pull)
  - use J, JB, or JJ

#### Advantages:

- Rigid base mounting due to large flange area
- Force is transferred along the centerline of the cylinder

### Side Tap Mounting – F / Side Lug Mounting – C

#### Application:

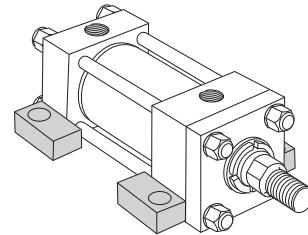

- Straight line force transfer
- Can be used in compression or tension loads
- Thrust key and secure mounting area are vital

#### Advantages:

- Ease of mounting

#### Recommendation:

- Styles F & C should have a minimum stroke at least equal to the bore diameter

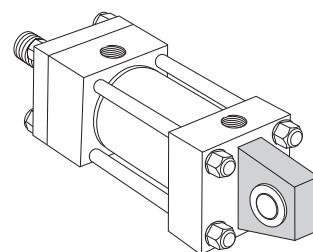

### Pivot Mountings – BB, SB and SE

#### Application:

- Curved or arc line force transfer
- Can be used in compression or tension loads
- Movement in a simple arc
  - use BB mountings
- Movement in a compound arc
  - use SB or SE mountings

#### Advantages:

- Ease of mounting
- Design flexibility
- Self aligning (SB or SE)

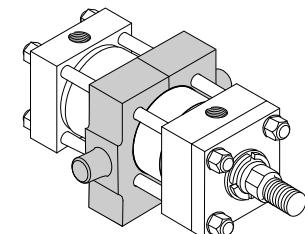

### Trunnion Mountings – D, DB, DD and DE

#### Application:

- Curved or arc line force transfer
- Can be used in compression or tension loads
- Compression loads – use DB or DD, DE mountings
- Tension loads – use D, DD or DE mountings

#### Advantages:

- Ease of mounting
- Design flexibility
- Self aligning

# The inside story on why H Series is your best choice in heavy duty hydraulic cylinders

**Primary Seal** – Tri-lip Rod Seal is a proven leakproof design – completely self-compensating and self-relieving to withstand variations and conform to mechanical deflection that may occur.

**Secondary Seal** – Double-Service urethane Wiperseal™ wipes clean any oil film adhering to the rod on the extend stroke and cleans the rod on the return stroke.

**Rod Bushing Assembly** – Externally removable without cylinder disassembly. Long bearing surface is inboard of the seals, assuring positive lubrication from within the cylinder. An o-ring is used as a seal between bushing and head.

**Piston Rod Thread** – Male rod end styles #4A and #8A are integral cut threads on the piston rod. Optional studded KK small male thread, for piston rod diameters 2.000" and smaller, is available by specifying rod end style #4H.

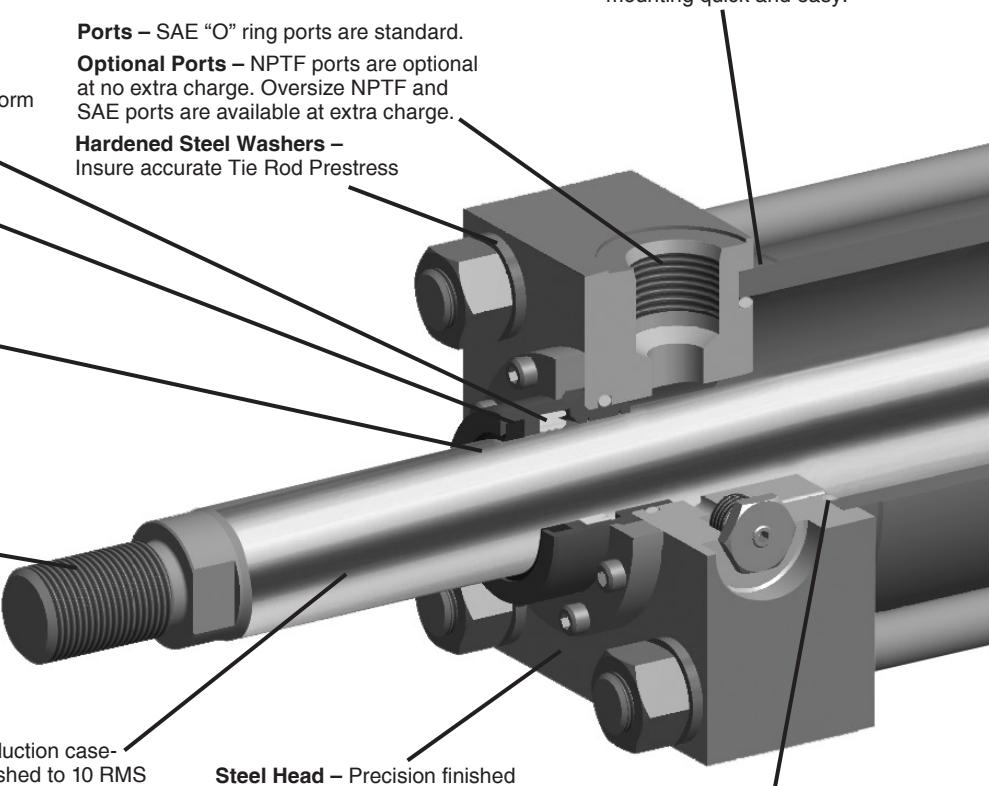

**Piston Rod** – Medium carbon steel, induction case-hardened, hard chrome-plated and polished to 10 RMS finish. Piston rods are made from 85,000 to 100,000 psi minimum yield material in .625" through 4.000" diameters. Larger diameters vary between 57,000 and 90,000 psi minimum material, depending on rod diameter.

**Ports** – SAE "O" ring ports are standard.

**Optional Ports** – NPTF ports are optional at no extra charge. Oversize NPTF and SAE ports are available at extra charge.

**Hardened Steel Washers** – Insure accurate Tie Rod Prestress

**Align-A-Groove** – A  $\frac{3}{16}$ " wide surface machined at each end of the cylinder body. Makes precise mounting quick and easy.

## Atlas's stepped floating cushions combine the best features of known cushion technology.

Deceleration devices or built-in "cushions" are optional and can be supplied at head end, cap end, or both ends without change in envelope or mounting dimensions. Atlas cylinder cushions are a stepped design and combine the best features of known cushion technology.

Standard straight or tapered cushions have been used in industrial cylinders over a very broad range of applications. Atlas research has found that both designs have their limitations.

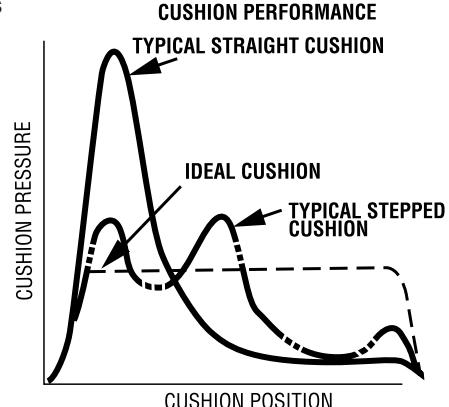

As a result, Atlas has taken a new approach in cushioning of industrial hydraulic cylinders and for specific load and velocity conditions have been able to obtain deceleration curves that come very close to the ideal. The success lies in a stepped sleeve or spear concept where the steps are calculated to approximate theoretical orifice area curves.

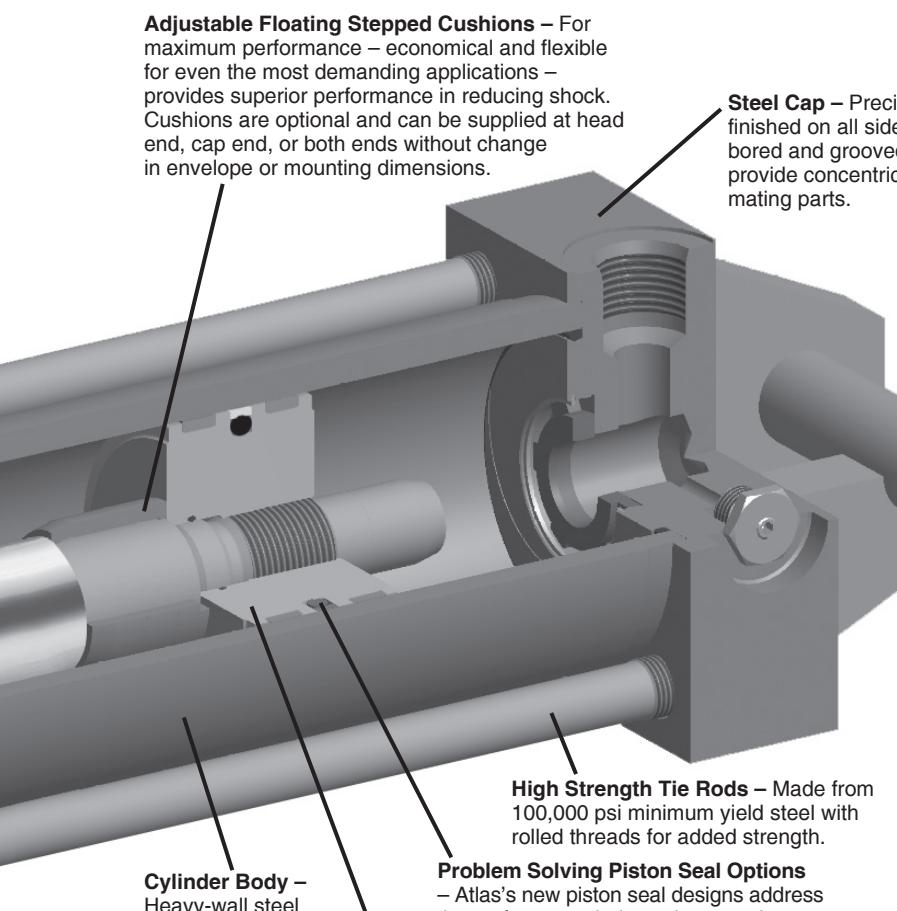

In the cushion performance chart, pressure traces show the results of typical orifice flow conditions. Tests of a three-step sleeve or spear show three pressure pulses coinciding with the steps. The deceleration cushion plunger curves shape comes

very close to being theoretical, with the exception of the last  $\frac{1}{2}$  inch of travel. This is a constant shape in order to have some flexibility in application. The stepped cushion design shows reduced pressure peaks for most load and speed conditions, with comparable reduction of objectionable stopping forces being transmitted to the load and the support structure.

All Atlas H cushions are adjustable.

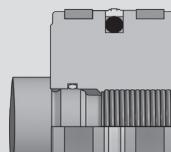

The H Series cylinder design incorporates the longest cushion sleeve and cushion spear that can be provided in the standard envelope without decreasing the rod bearing and piston bearing strengths.

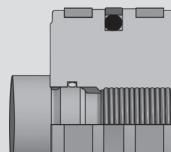

**Cylinder Body** – Heavy-wall steel tubing, honed to a micro finish bore.

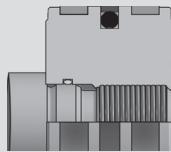

### One Common Piston for 4 Seal Styles

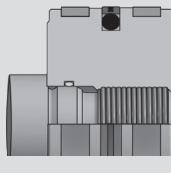

**Standard HP** style with polyurethane piston seal – excellent for most cycling and load holding applications.

**Optional KP** style with filled PTFE piston seal – low friction, high heat resistance for cycling and load holding service.

**Optional RP** style with thermoplastic piston seal – superior extrusion resistance to extreme pressure spikes with drift-free performance.

**Optional WP** style mixed media piston seal – low friction primary seal with redundant elastomer delivers superior performance with dissimilar media on either side of the piston.

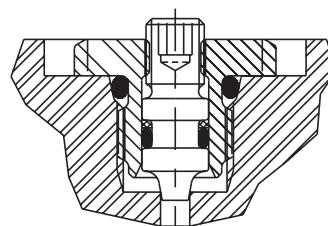

Application Demand	HP Seal	KP Seal	RP Seal	WP Seal
<b>Load Holding</b>	Best	Good	Good	Best
<b>Fluid Compatibility</b>	Good	Best	Better	Better
<b>Heat Resistance</b>	Good	Best	Better	Better
<b>Dynamic Friction</b>	Best	Best	Good	Better
<b>Breakaway Friction</b>	Good	Best	Good	Better
<b>Extrusion Resistance</b>	Good	Better	Best	Good
<b>Fluid Isolation</b>	N/A	N/A	N/A	Best

(1) When a cushion is specified at the head end:

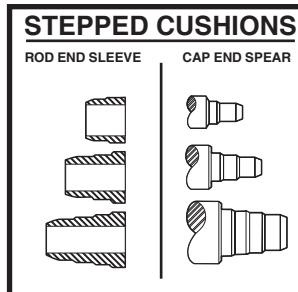

- A self-centering stepped sleeve is furnished on the piston rod assembly.
- A cartridge style needle valve is provided that is flush with the side of the head even when wide open. It is located on side number 2, in all mounting style models except ME5, ME6, TM1, TM2, TM3 and TM4. In these styles it is located on side number 3.
- All cylinder bores utilize a slotted sleeve as a check valve.

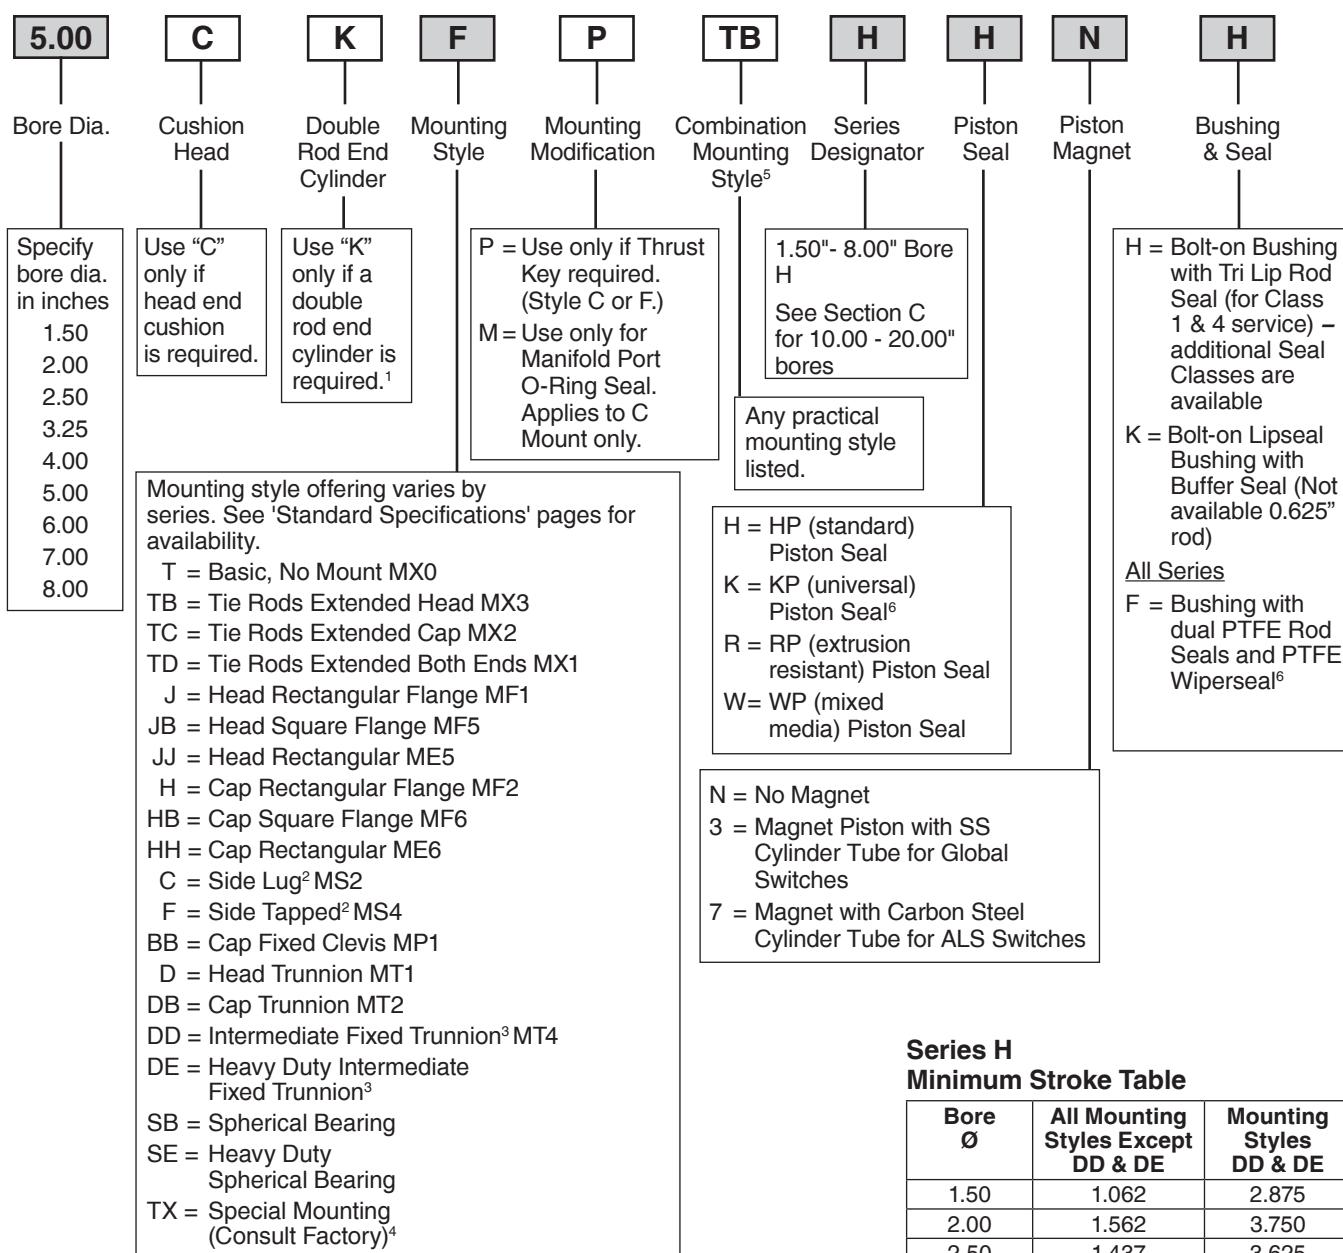

(2) When a cushion is specified at the cap end:

- A stepped cushion spear is provided on the piston rod.
- A "float check" self-centering bushing is provided in 1.50" - 6.00" bore cylinders, which incorporates a large flow check valve for fast "out-stroke" action. 7.00" bore and larger cylinders utilize a springless check valve located and identified in the same manner as the head end.
- A cartridge style needle valve is provided that is flush with the side of the cap when wide open. It is located on side number 2 in all models except ME5, ME6, TM1, TM2, TM3 and TM4. In these styles it is located on side number 3.

**Cartridge Style Needle Valve**

**H Model Code**Overview  
**A**

Shaded boxes identify required model number fields.

<sup>1</sup> Available mounting styles for K Type cylinders are located at the end of Section A. When ordering a double rod end cylinder, the piston rod number and piston rod end threads are to be specified for both rod ends.

The model number should be created as viewing the primary rod end on the left hand side.

Example: K Type Cylinder:

4.00CKTDHT14A28AC10.000

<sup>2</sup> Mounting Styles C and F should have a minimum stroke length equal to or greater than their bore size.

<sup>3</sup> Specify XI dimension.

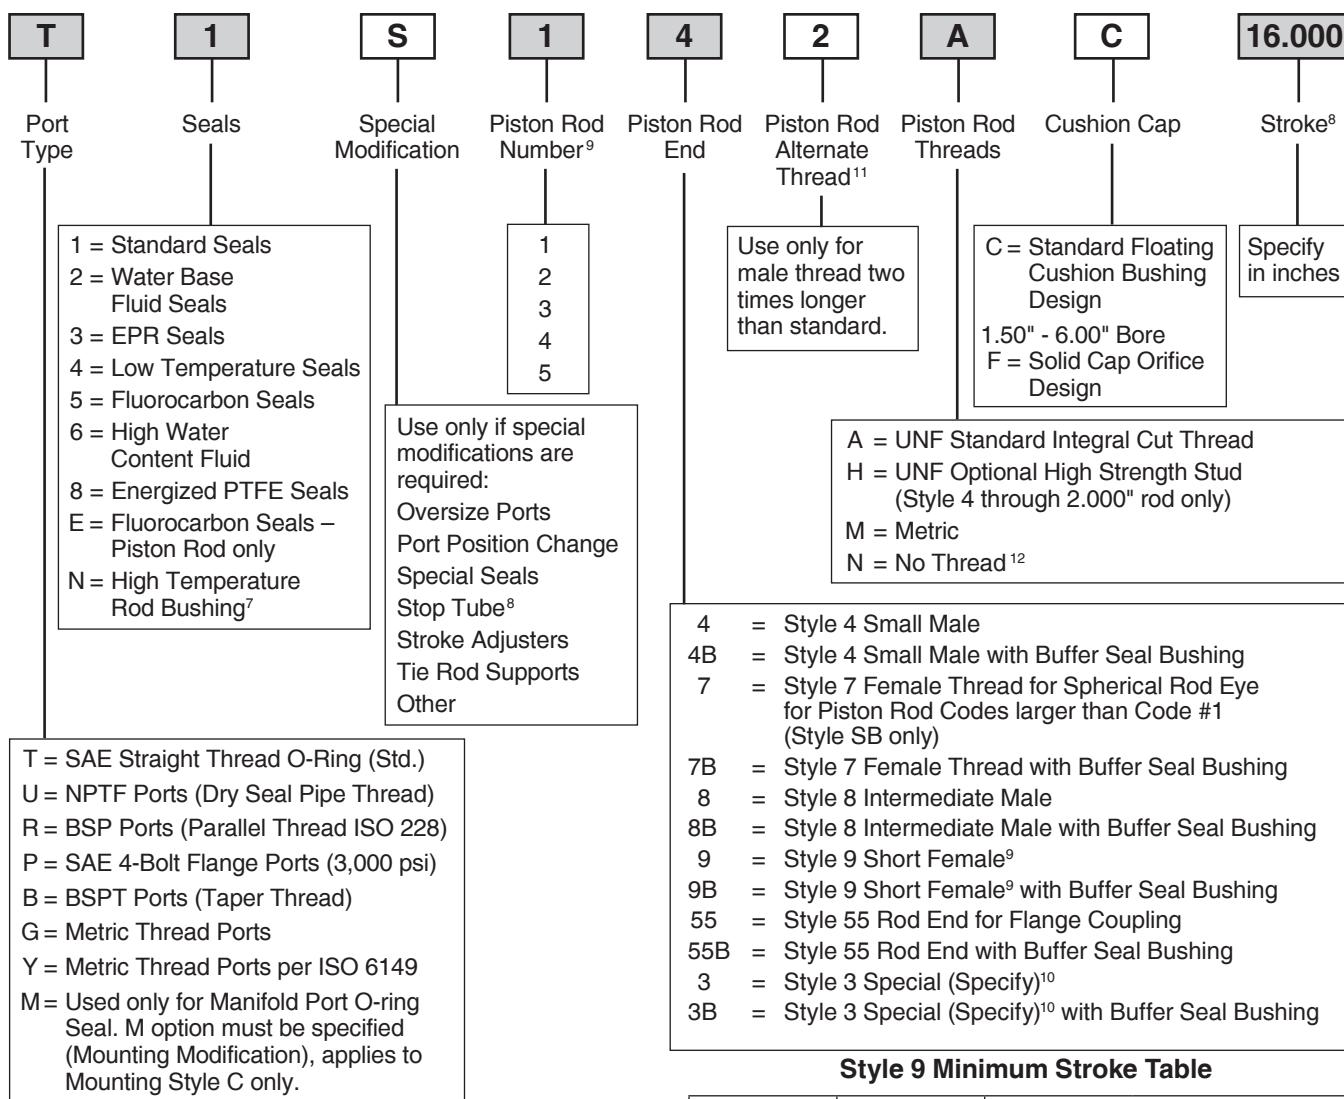

<sup>4</sup> Special mounting styles that do not resemble a standard catalog offering will be designated as style TX by the factory.

<sup>5</sup> In general, the model numbers as read left to right corresponding to the cylinder as viewed from left to right with the primary end at the left. The second or subsequent mountings are mountings called out as they appear in the assembly moving away from the rod end. Except when tie rod extension mountings are part of a combination, all combinations should have a "S" (Special) in the model code and a note in the body of the order clarifying the mounting arrangement. The "P", as used to define a thrust key is not considered to be a mounting. However it is located at the primary end.

<sup>6</sup> Piston seal code K and Bushing & Seal code F must be selected for Class 8 service. Dual PTFE rod seals with PTFE wiperseal not available for 0.625" rod.

**Series H**  
**Minimum Stroke Table**

Bore Ø	All Mounting Styles Except DD & DE	Mounting Styles DD & DE
1.50	1.062	2.875
2.00	1.562	3.750
2.50	1.437	3.625
3.25	1.687	4.375
4.00	1.937	5.000
5.00	1.937	5.437
6.00	2.562	6.687
7.00	3.437	8.062
8.00	2.937	8.250

**H Model Code**

Shaded boxes identify required model number fields.

<sup>7</sup> Energized PTFE rod seals & wiperseal. All other cylinder seals are fluorocarbon. Not available for 0.625" rod.

<sup>8</sup> S = Stop Tube. Specify: stop tube length, net stroke and gross stroke. Gross stroke = stop tube length + net stroke. Gross stroke to be placed in the model number field.

Example:

2.000 inches long stop tube

+14.000 inches net stroke

16.000 inches gross stroke

See tables on these pages for minimum allowable strokes for Series H and Piston Rod End Styles 9 &amp; 9B.

<sup>9</sup> Style 9 stroke restrictions may apply. See Style 9 Minimum Stroke Table for details.

<sup>10</sup> Provide dimensions for KK, A, W or WF. If otherwise special, furnish dimensioned sketch.

<sup>11</sup> Available only in combination with Style 4 or Style 8.

<sup>12</sup> Must be specified for Piston Rod End Style 55.

**Style 9 Minimum Stroke Table**

Bore Ø	Rod Ø	Minimum Stroke	
		Style 9	Style 9B
1.50 - 4.00	All	None	None
	2.000	None	None
	2.500	1.000	0.56
	3.000	1.375	0.94
	3.500	1.625	1.19
5.00	2.500	None	None
	3.000	1.375	0.94
	3.500	1.375	0.94
	4.000	2.000	1.56

	3.500	1.500	1.06

### Piston Seal Selection

Atlas Piston Seal options HP, KP, RP and WP are available in a number of different Seal Classes. Because the Atlas Model Number includes Seal Class but does not include a code for piston seal style, a default piston seal style is designated for each seal class. In the table below rows list each seal class and columns column list each piston style. Available piston styles

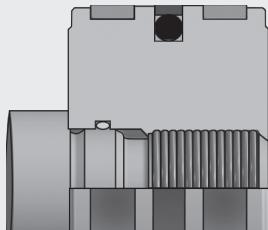

for each seal class are identified with an 'X' and the default piston seal style is in the shaded cell. To specify an available piston seal style that is not standard, place an 'S' in the Special Modification field of the model number and specify the required piston seal style with text.

Seal Class	Piston Seal Options (Shaded cell is default standard)			
	HP	KP	RP	WP
Class 1 - Polyurethane & Nitrile	X	X	X	X
Class 2 - Nitrile	N/A	X	X	X
Class 3 - EPR	N/A	X	X	X
Class 4 - Low Temperature Nitrile	X	X	X	N/A
Class 5 - Fluorocarbon	N/A	X	X	X
Class 5 Rod Bushing Seals Only	N/A	X	X	X
Class 6 - Nitroxile	N/A	X	X	X
Class 8 - Filled PTFE High Temperature	N/A	X	N/A	N/A
Class 8 Rod Bushing Seals Only (all others Fluorocarbon)	N/A	N/A	X	X

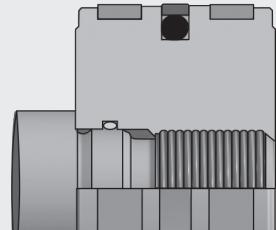

### One Common Piston for 4 Seal Styles

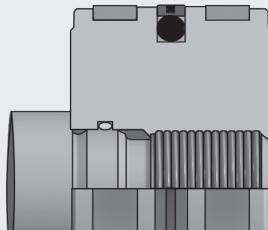

**Standard HP style with polyurethane piston seal – excellent for most cycling and load holding applications.**

**Optional RP style with thermoplastic piston seal – superior extrusion resistance to extreme pressure spikes with drift-free performance.**

**Optional KP style with filled PTFE piston seal – low friction, high heat resistance for cycling and load holding service.**

**Optional WP style mixed media piston seal – low friction primary seal with redundant elastomer delivers superior performance with dissimilar media on either side of the piston.**

**Standard Specifications**

- Heavy Duty Service – ANSI/(NFPA) T3.6.7R3 - 2009 Specifications and Mounting Dimension Standards
- Standard Construction – Square Head – Tie Rod Design
- Nominal Pressure – 3000 psi<sup>1</sup>
- Standard Fluid – Hydraulic Oil
- Standard Temperature – -10°F to +165°F<sup>2</sup>
- Bore Diameters – 1.50" through 8.00" (Larger sizes available)

*In line with our policy of continuing product improvement, specifications in this catalog are subject to change.*

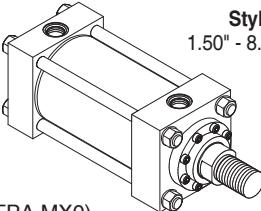

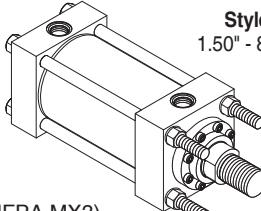

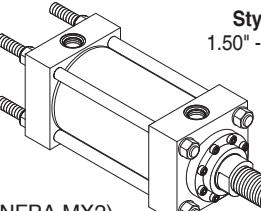

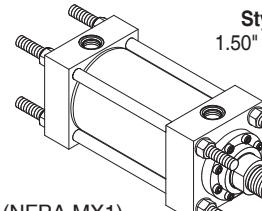

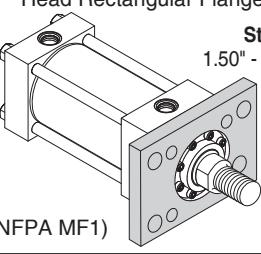

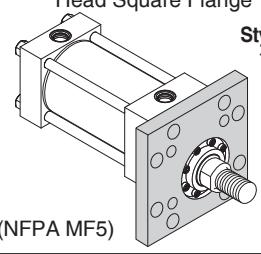

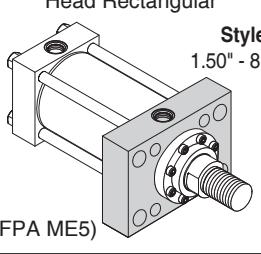

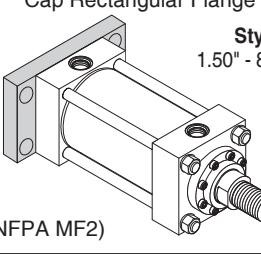

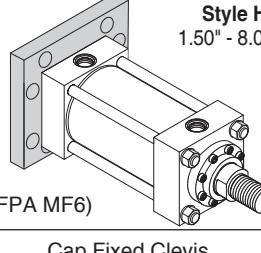

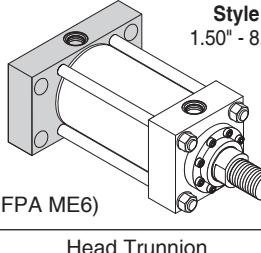

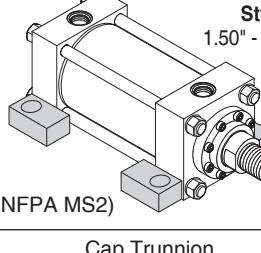

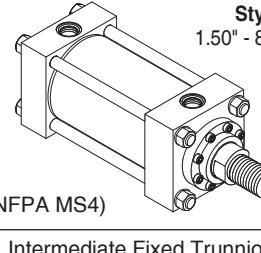

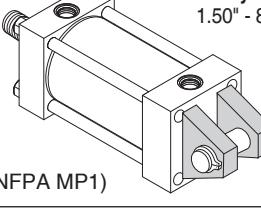

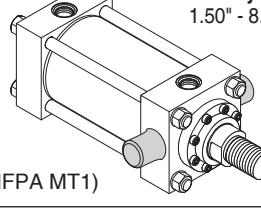

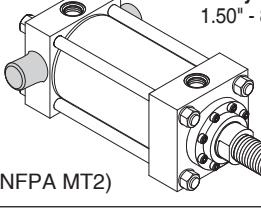

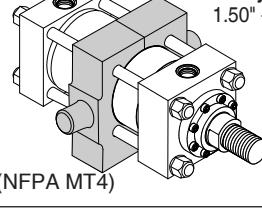

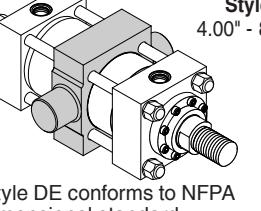

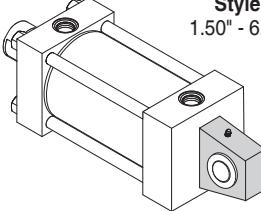

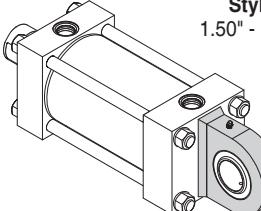

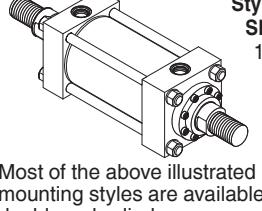

Note: H Series Hydraulic Cylinders fully meet ANSI/(NFPA) T3.6.7R3 - 2009 Specifications and Mounting Dimension Standards for Square Head Industrial Fluid Power Cylinders.

- Piston Rod Diameter – 0.625" through 5.500"
- Mounting Styles – 19 standard styles at various application ratings
- Strokes – Available in any practical stroke length
- Cushions – Optional at either end or both ends of stroke. "Float Check" standard at cap end of 1.50" - 6.00" bore.
- Rod Ends – Four Standard Choices – Specials to Order

<sup>1</sup> If hydraulic operating pressure exceeds 3000 psi, send application data for engineering evaluation and recommendation. See Section D for actual design factors.

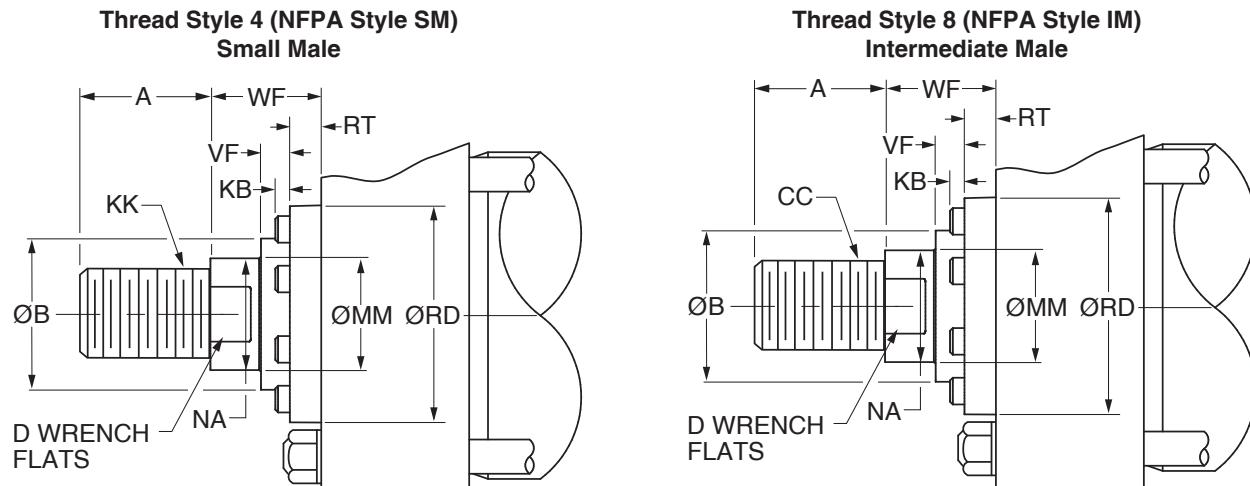

<sup>2</sup> See Section D for higher temperature service.

**"Special" Thread Style 3 (Previous Style X)**

Special thread, extension, rod eye, blank, etc., are also available.

To order, specify "Style 3" and give desired dimensions for KK, A, W or WF. If otherwise special, furnish dimensioned sketch.

**Rod End Dimensions – circular bolt-on retainer construction**

See Bushing Retention page to determine which bore, rod and mounting style combinations have circular bolt-on retainers and which have tie rod retained bushings.

**"Special" Thread Style 3 (Previous Style X)**

Special thread, extension, rod eye, blank, etc., are also available.

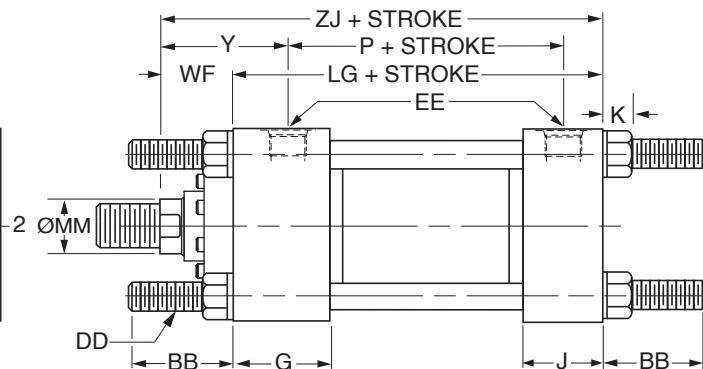

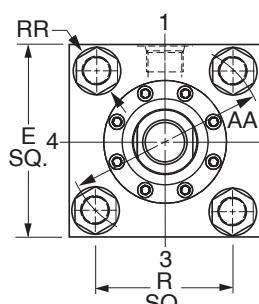

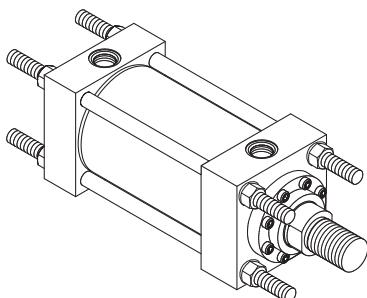

To order, specify "Style 3" and give desired dimensions for KK, A, W or WF. If otherwise special, furnish dimensioned sketch.

<sup>1</sup> For special WG dimension, specify "Style 3" and give desired dimension for WG. For other changes, place "S" in the model code, and describe rod end with dimensioned sketch.

<sup>2</sup> Style 9 stroke restrictions may apply. See Style 9 Minimum Stroke Table on How to Order page for details.

<sup>5</sup> To match pin diameter in rod eye and cap, when an oversize rod is required, specify rod end style '3', 'CC' thread and 'A' thread length for the standard rod diameter (Rod No. 1 for the bore), and 'WF' for the oversize rod. Order the rod eye and clevis bracket for the required bore size from the tables on the Style SE Spherical Bearing Accessories page.

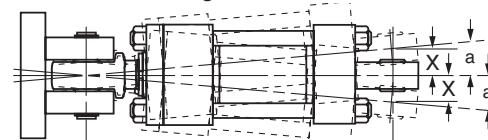

**Style SE – Recommended maximum swivel angle on each side of the cylinder centerline.**

<sup>1</sup> Connect load to piston rod without 'V' notch. If only one end of the Double Rod Cylinder is to be cushioned, be sure to clearly specify which end this will be.

<sup>2</sup> Specify XI dimension for Styles DD & DE from #1 rod end (without 'V' notch).

**How to Use Double Rod Cylinder Dimension Drawings**

To determine dimensions for a double rod cylinder, first refer to the desired single rod mounting style cylinder shown on preceding pages of this catalog. (See table above.) After selecting necessary dimensions from that drawing, return to this page supplement the single rod dimensions with those shown on drawing at right and dimension table below. Note that double rod cylinders have a head (Dim. G) at both ends and that dimension LH replaces LG. The double rod dimensions differ from, or are in addition to those for single rod cylinders shown on preceding pages and provide the information needed to completely dimension a double rod cylinder.

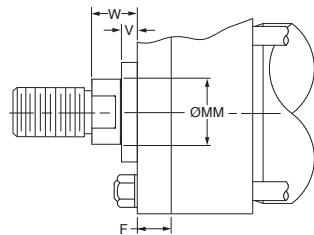

On a double rod cylinder where the two rod ends are different, be sure to clearly state which rod end is to be assembled at which end. Port position 1 is standard. If other than standard, specify pos. 2, 3 or 4 when viewed from rod end #1 only.

**"Special" Thread Style 3**

Special thread, extension, rod eye, blank, etc., are also available.

To order, specify "Style 3" and give desired dimensions for KK, A, W or WF. If otherwise special, furnish dimensioned sketch.

<sup>1</sup> For special WG dimension, specify "Style 3" and give desired dimension for WG. For other changes, place "S" in the model code, and describe rod end with dimensioned sketch.

<sup>2</sup> Style 9 stroke restrictions may apply. See Style 9 Minimum Stroke Table on How to Order page for details.

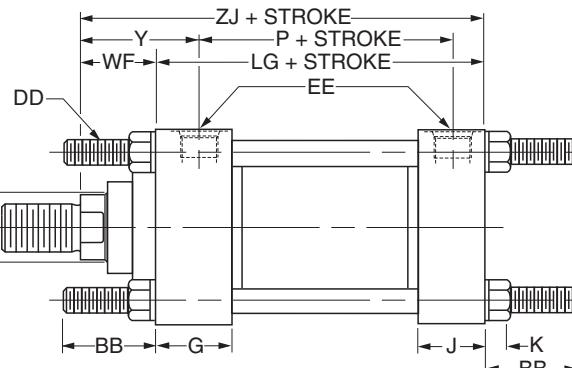

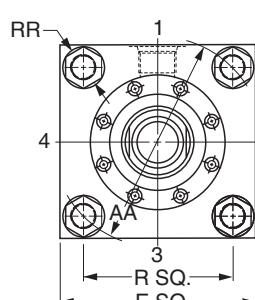

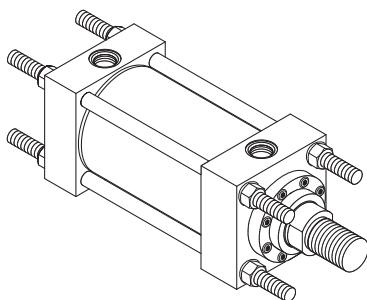

<sup>3</sup> These piston rod numbers will have 4 spanner wrench holes instead of wrench flats. See rod drawings on 3H Large Bore Piston Rod Ends page for dimensions.

**Style 55 Rod End**

<sup>1</sup> Connect load to piston rod without 'V' notch. If only one end of the Double Rod Cylinder is to be cushioned, be sure to clearly specify which end this will be.

<sup>2</sup> Specify XI dimension for Styles DD & DE from #1 rod end (without 'V' notch).

**How to Use Double Rod Cylinder Dimension Drawings**

To determine dimensions for a double rod cylinder, first refer to the desired single rod mounting style cylinder shown on preceding pages of this catalog. (See table above.) After selecting necessary dimensions from that drawing, return to this page supplement the single rod dimensions with those shown on drawing at right and dimension table below. Note that double rod cylinders have a head (Dim. G) at both ends and that dimension LH replaces LG. The double rod dimensions differ from, or are in addition to those for single

Bore Ø	Rod No.	MM Rod Ø	WF	Add Stroke		Add 2X Stroke

rod cylinders shown on preceding pages and provide the information needed to completely dimension a double rod cylinder.

On a double rod cylinder where the two rod ends are different, be sure to clearly state which rod end is to be assembled at which end. Port position 1 is standard. If other than standard, specify pos. 2, 3 or 4 when viewed from rod end #1 only.

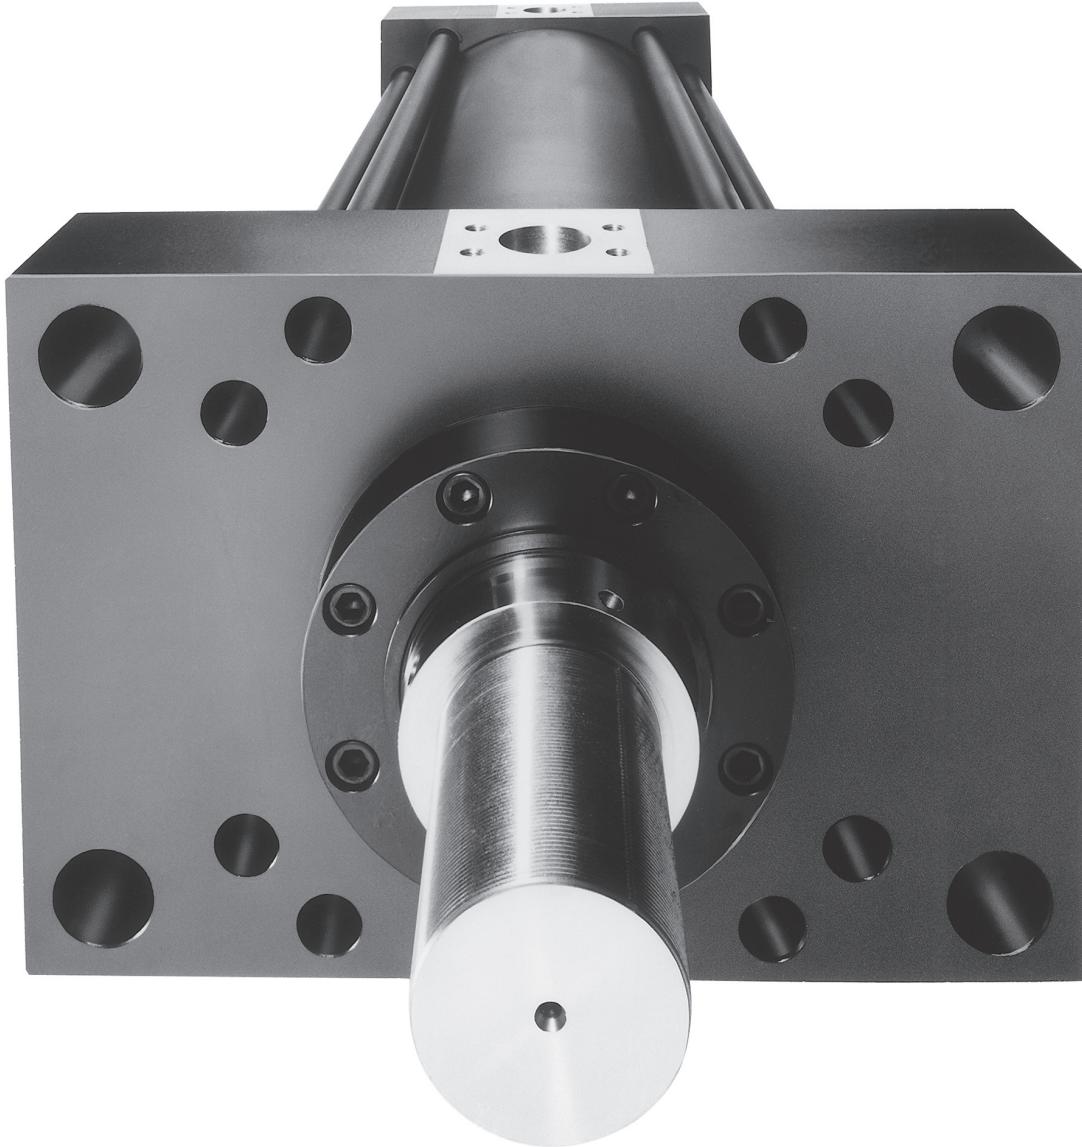

## The large bore, high pressure hydraulic cylinder Atlas designed to meet your needs

Atlas H Series large bore cylinders provide unmatched reliability, performance, and innovative design features that aid in increasing productivity while reducing operating costs.

Atlas's externally removable bolted bushing assembly makes preventive and routine maintenance quick and easy! In many cases, the cylinder does not have to be removed or disassembled to facilitate service. Our innovative design provides for fast turn around, reduced downtime, and increased productivity.

In addition to our removable bushing assembly, H Series cylinders also include a multitude of innovative design features such as: anti-extrusion body end seals, floating cushions, hi load piston (standard), and various port and rod end options to meet your application requirements.

Every H Series cylinder is individually tested before leaving our plant to assure proper and leak free operation. All H Series cylinders come with an eighteen month warranty standard.

10.00" - 20.00" Bore  
H Series  
C

# These innovative design features make Atlas H Series your best choice... for all your large bore heavy duty hydraulic cylinder applications.

**Primary Seal** – High-performance urethane design combines ease of installation with rugged construction. The ultimate seal in extra heavy duty applications. Completely self-compensating and self-relieving to withstand pressure variations and conform to mechanical deflection that may occur.

**Piston Rod** – Hard chrome-plated and polished for maximum seal and rod bearing life. Two standard thread styles. Rod end is supplied with spanner wrench holes.

**Align-A-Groove** – A  $\frac{3}{16}$ " wide surface machined at each end of the cylinder body. Makes precise mounting quick and easy.

**Secondary Seal** – Double-Service Wiperseal™ – wipes clean any oil film adhering to the rod on the extend stroke and cleans the rod on the return stroke.

**Rod Bushing** – Standard Composite Load Bearing Bushing offers superior performance in comparison to metal and nylon filled alternatives.

**The Cylinder Body** – Heavy-wall steel tubing is honed to a micro finish bore, providing a wear surface for long lasting piston bearing and seal life.

**Piston Seals** – Problem solving piston seal options.

**Ports** – SAE O-ring straight thread ports are standard.

**Bolted Bushing Assembly** – Externally removable without cylinder disassembly. Long composite bearing surface is inboard of the seals, assuring positive lubrication from within the cylinder. An "O" ring is used as a seal between bushing and head.

**Adjustable Floating Stepped Cushions** – For maximum performance. Economical and flexible for even the most demanding applications. Provides superior performance in reducing shock. Cushions are optional and can be supplied at head end, cap end, or both ends without change in envelope or mounting dimensions.

**Alloy Steel Tie Rod Nuts** – With hardened washer.

**Steel Head** – Bored and grooved to provide concentricity for mating parts.

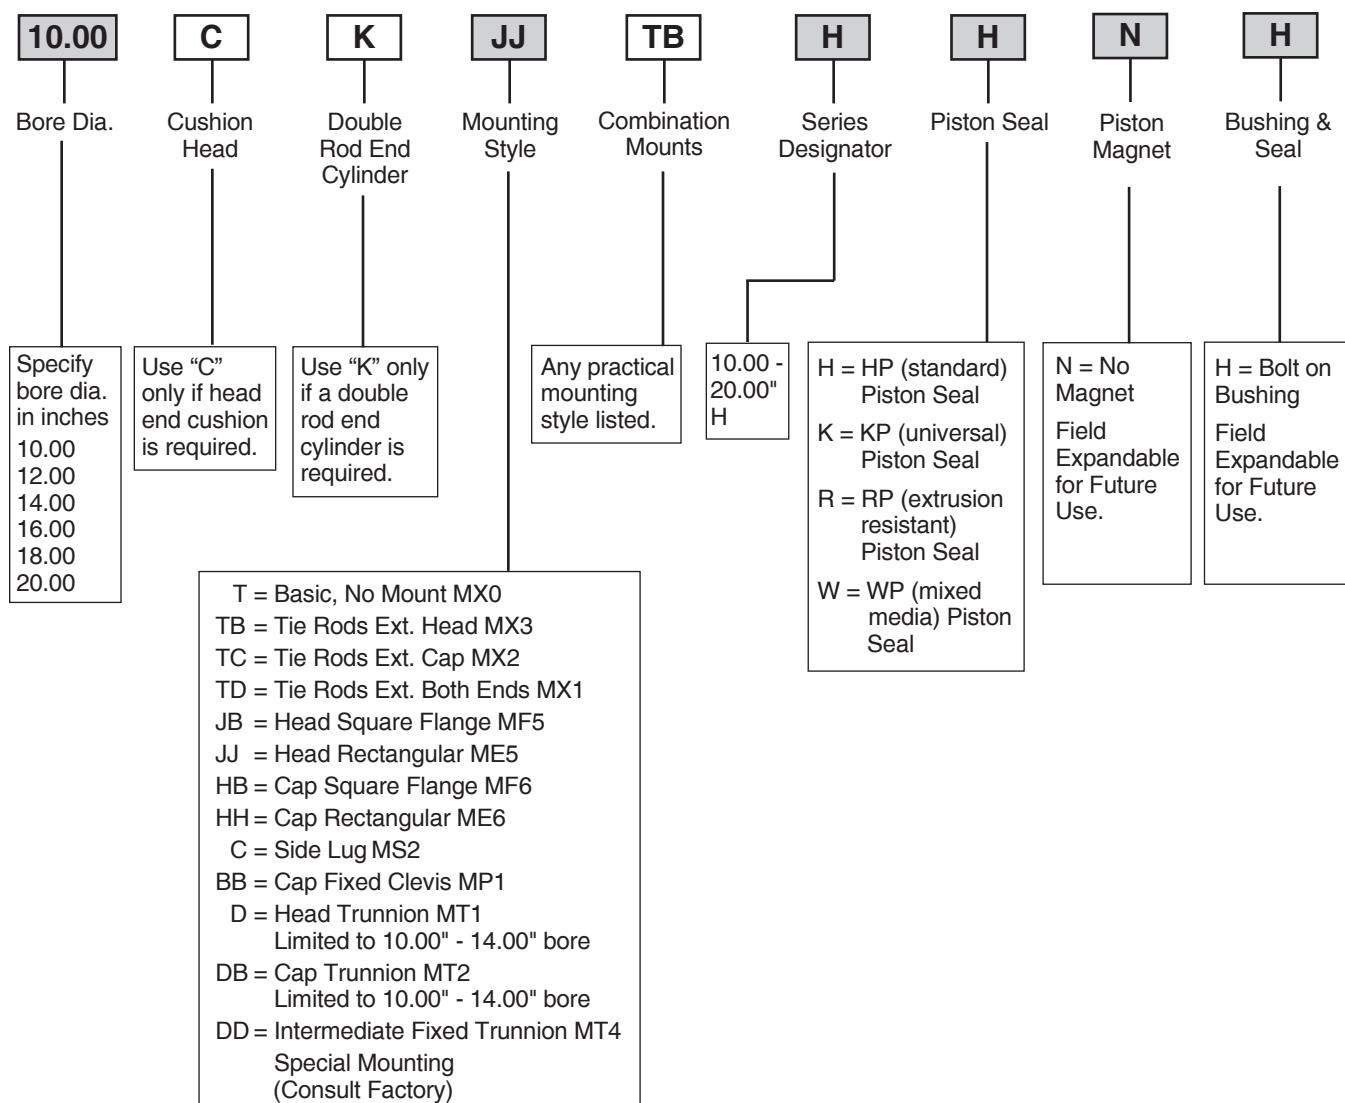

**High Strength Tie Rods** – Made from 100,000 PSI minimum yield steel with rolled threads for added strength.

**End Seals** – Pressure-actuated cylinder body-to-head and cap "O" rings (urethane 10.00" - 14.00") and back-up washers.

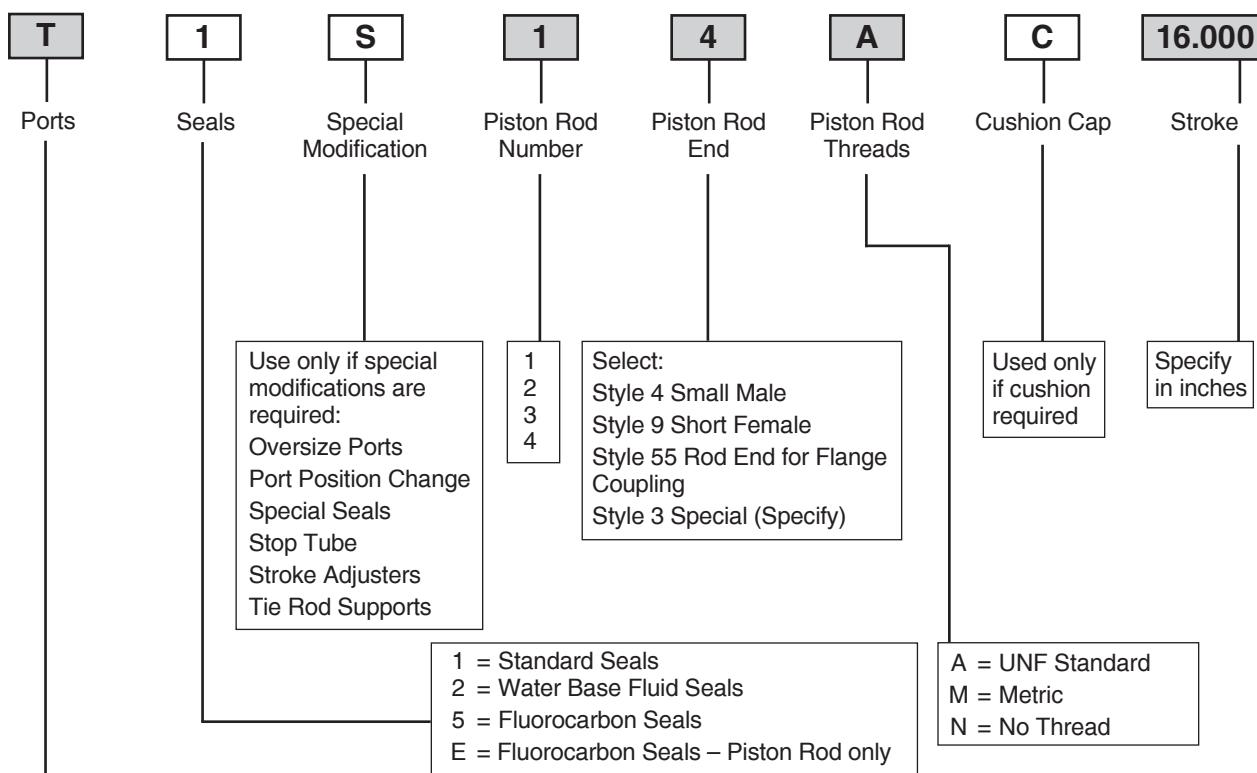

**Steel Cap** – Bored and grooved to provide concentricity for mating parts.

**One-Piece Modular Iron Piston** – The wide piston surface contacting cylinder bore reduces bearing loads. One piece design is piloted to piston rod assuring concentricity. Piston is locked with set screw. Anaerobic adhesive and peening of set screw locks and seals piston to rod.

**H Series**  
10.00" - 20.00" Bore

**H Model Code**

Shaded boxes identify required model number fields.

**H Model Code**

T = SAE Straight Thread O-Ring (Std.)

U = NPTF Ports (Dry Seal Pipe Thread) (10.00" - 14.00")

R = BSP Ports Parallel Thread ISO 228 (10.00" - 14.00")

P = SAE Flange Ports (3,000 psi)

B = BSPT Ports (Taper Thread) (10.00" - 14.00")

G = Metric Thread Ports (10.00" - 14.00")

Y = Metric Thread Ports per ISO 6149 (10.00" - 14.00")

**Style 9 Minimum Stroke Table**

Bore Ø	Rod Ø	Minimum Stroke

	10.000	3.250
18.00	9.000	1.500
	10.000	2.250
20.00	10.000	1.250

Shaded boxes identify required model number fields.

### Piston Seal Selection

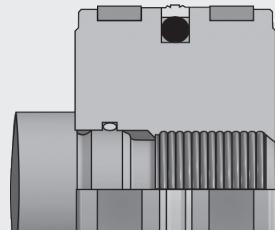

Atlas Piston Seal options HP, KP, RP and WP are available in a number of different Seal Classes. Because the Atlas Model Number includes Seal Class but does not include a code for piston seal style, a default piston seal style is designated for each seal class. In the table below rows list each seal class and columns list each piston style. Available piston styles for each

seal class are identified with an 'X' and the default piston seal style is in the shaded cell. To specify an available piston seal style that is not standard, place an 'S' in the Special Modification field of the model number and specify the required piston seal style with text.

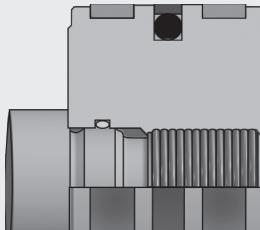

<b>Seal Class</b>	<b>Piston Seal Options</b> (Shaded cell is default standard)			
	<b>HP</b>	<b>KP</b>	<b>RP</b>	<b>WP</b>
Class 1 - Polyurethane & Nitrile	X	X	X	X
Class 2 - Nitrile	N/A	X	X	X
Class 5 - Fluorocarbon	N/A	X	X	X
Class 5 Rod Bushing Seals Only	N/A	X	X	X

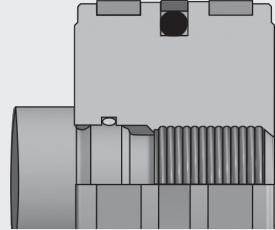

### One Common Piston for 4 Seal Styles

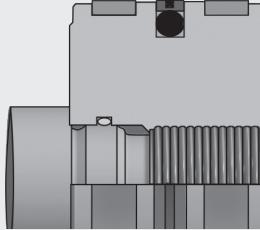

**Standard HP style with polyurethane piston seal** – excellent for most cycling and load holding applications.

**Optional RP style with thermoplastic piston seal** – superior extrusion resistance to extreme pressure spikes with drift-free performance.

**Optional KP style with filled PTFE piston seal** – low friction, high heat resistance for cycling and load holding service.

**Optional WP style mixed media piston seal** – low friction primary seal with redundant elastomer delivers superior performance with dissimilar media on either side of the piston.

# **H Series Large Bore Composite Bushing**

Innovative Solutions from  
Atlas Cylinders

## **Customer Value Proposition:**

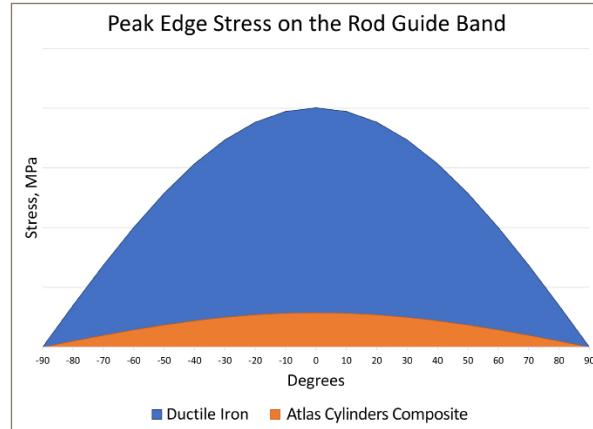

The Atlas Cylinders H Series Large Bore Composite Bushing installed inboard of the primary rod sealing package offers significant performance improvements in comparison to Metal or Filled Nylon Rod Bushings

## **Contact Information:**

Atlas Cylinders  
**Cylinder Division**  
500 S. Wolf Rd.  
Des Plaines, IL 60016  
[www.atlas-cylinders.com](http://www.atlas-cylinders.com)

phone 847 298 2400  
fax 800 892 1008

### **Key Takeaway:**

Contact stress is reduced when any side load force is distributed over a greater area.  
See how Atlas Cylinders' composite bearing performs over Ductile Iron.

## **Product Features:**

### **Atlas' Composite Versus Metal Bushings**

- Better ability to conform to bending deflections resulting in lower peak stresses
- Non-corrosive
- Self lubricating with lower friction
- Ideal for High Water Content fluids

### **Atlas' Composite Versus Filled Nylon Bushings**

- Higher strength
- Very low water absorption
- Wider temperature range

**Standard Specifications**

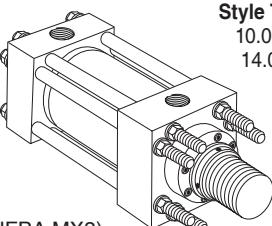

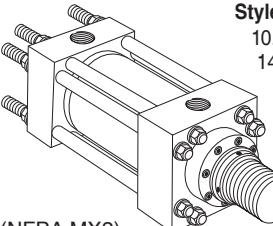

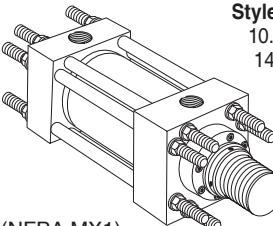

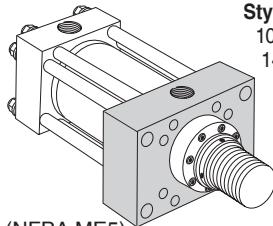

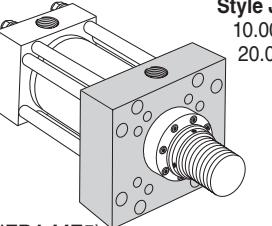

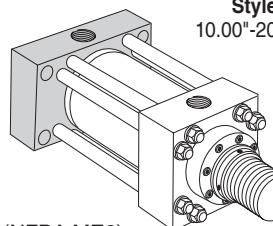

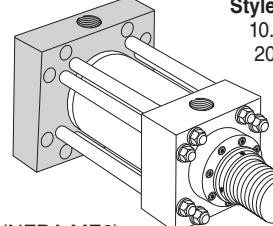

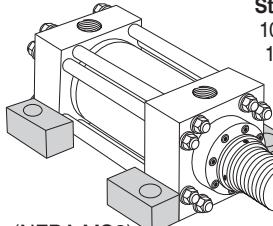

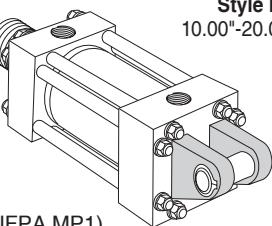

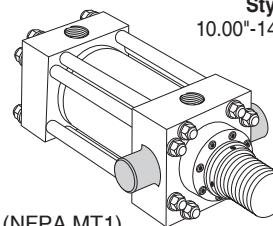

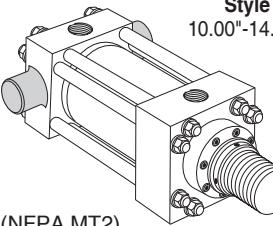

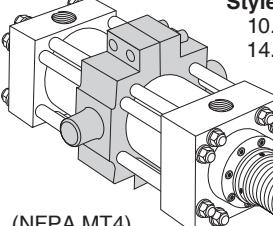

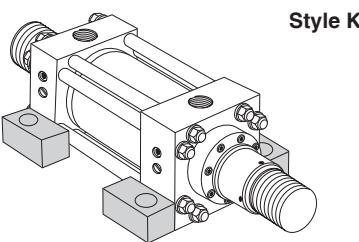

- Heavy Duty Service
- Standard Construction – Square Head – Tie Rod Design
- Nominal Pressure – 3000 psi<sup>1</sup>
- Standard Fluid – Hydraulic Oil
- Standard Temperature – -10°F to +165°F
- Bore Sizes – 10.00" through 20.00"
- Piston Rod Diameter – 4.500" through 10.000"

- Mounting Styles – 12 standard styles at various application ratings
- Strokes – Available in any practical stroke length
- Cushions – Optional at either end or both ends of stroke
- Rod Ends – Three Standard Choices – Specials to Order

<sup>1</sup> If hydraulic operating pressure exceeds 3000 psi, send application data for engineering evaluation and recommendation.

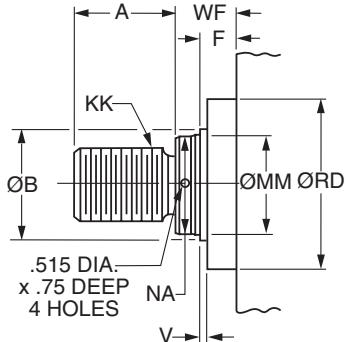

In line with our policy of continuing product improvement, specifications in this catalog are subject to change.

**H Series**  
**10.00" - 20.00" Bore**

**"Special" Thread Style 3**

Special thread, extension, rod eye, blank, etc., are also available.

To order, specify "Style 3" and give desired dimensions for KK, A & WF. If otherwise special, furnish dimensioned sketch.

<sup>1</sup> For special WG dimension, specify "Style 3" and give desired dimension for WG. For other changes, place "S" in the model code, and describe rod end with dimensioned sketch.

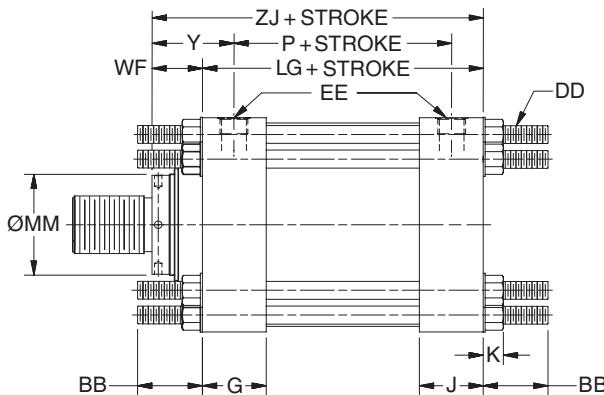

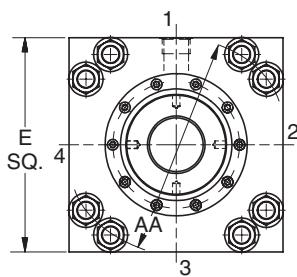

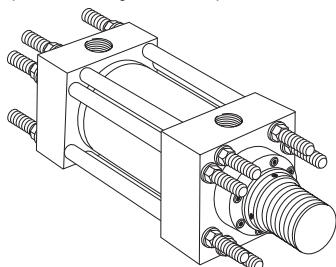

<sup>2</sup> Style 9 stroke restrictions may apply. See Style 9 Minimum Stroke Table on How to Order page for details.

**Style 55 Rod End**

**How to Use Double Rod Cylinder Dimension Drawings**

To obtain dimensioning information on a double rod cylinder, first select the desired mounting style and refer to the corresponding single rod cylinder model shown on the preceding pages. (See table above.) After you have determined all necessary dimensions from that drawing, turn back to this page and supplement those dimensions with additional ones from the drawing above and table at right. These added dimensions differ from, or are in addition to, those shown on the preceding pages and

provide the additional information needed to completely dimension a double rod cylinder model.

On a double rod cylinder where the two rod ends are different, be sure to clearly state which rod end is to be assembled at which end. Port position 1 is standard. If other than standard, specify pos. 2, 3 or 4 when viewed from rod end #1 only.

### Rod Extension Dimensions for Buffer Seal Glands

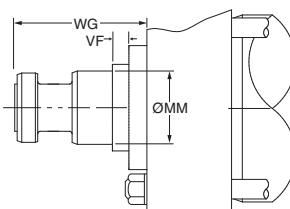

Buffer Seal glands are from 0.31" to 0.81" longer (see table at right) than glands without a Buffer Seal. The longer gland causes the piston rod to extend beyond its location for a standard gland. A differentiating rod end style 4B vs. 4, 9B vs. 9 etc. must also be specified when selecting the Buffer Seal gland option. Rod end extension dimensions – V, VF, W, WF and WG – for Buffer Seal rod end styles are in the table at right. All other rod end dimensions are unchanged and can be found on the Piston Rod Ends page for each series.

**Style 9B –  
Short Female**

**Style 55B –  
Flanged Rod End**

Bore Ø	Rod No.	MM Rod Ø	Gland Length Increase	V <sup>1</sup>	VF	W <sup>1</sup>	WF	WG <sup>2</sup>

	5	4.500	0.44	0.94	0.78	1.69	2.69	6.50
8.00	1 (Std.)	3.500	0.44	1.06	0.78	1.69	2.69	5.63
	2	5.500	0.81	1.15	1.15	2.06	3.06	7.50
	3	4.000	0.44	0.94	0.78	1.69	2.69	5.75
	4	4.500	0.44	0.94	0.78	1.69	2.69	6.50
	5	5.000	0.81	1.15	1.15	2.06	3.06	6.63

<sup>1</sup> 'V' and "W" dimensions are for Mounting Styles J & JB and tie rod retained gland styles.

<sup>2</sup> The 'WG' dimension for Buffer Seal Glands matches the 'WG' for standard glands.

**Common & Custom Modifications**

**Modifications:** The following modifications can be supplied on most Atlas cylinders.

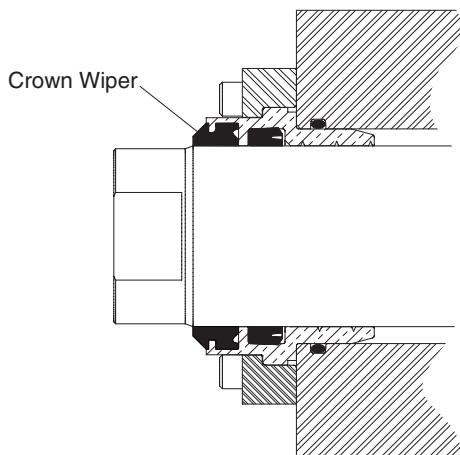

**Metallic Rod Scraper**

When specified metallic rod scrapers can be supplied instead of the standard synthetic rubber wiperseal. Recommended in applications where contaminants tend to cling to the extended piston rod and would damage the synthetic rubber wiperseal. Installation of metallic rod scraper does not affect cylinder dimensions. It is available at extra cost.

**Atlas Crown Wiper™ for Series H and 7.00" & 8.00" bore**

For environments that contain fine abrasive particulate specify the Crown Wiper option. The Crown Wiper is a proven superior alternative to piston rod end boots or metallic wipers that can ingest particulate. It has a sharp leading edge to effectively clean the piston rod and a beveled shape to prevent contaminant intrusion by channeling it away from the bushing. It also acts as a secondary seal to wipe clean any oil film adhering to the rod on the extend stroke.

Standard Crown Wiper material for Seal Class 1 and 4 service is durable polyurethane. Optional FKM material is available for Class 5 service. The Crown Wiper requires a unique bushing but does not change cylinder mounting dimensions

**Heavy Duty Hydraulic Cylinders****H Series****Rod End Boots**

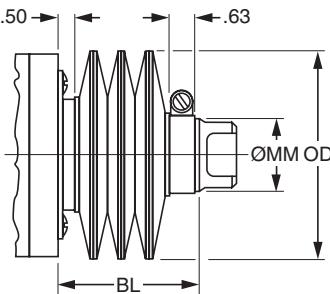

Cylinders have a hardened bearing surface on the piston rod to resist external damage, and are equipped with the high efficiency "Wiperseal" to remove external dust and dirt. Exposed piston rods that are subjected to contaminants with air hardening properties, such as paint, should be protected. In such applications, the use of a collapsing cover should be considered. This is commonly referred to as a "boot". Calculate the longer rod end required to accommodate the collapsed length of the boot from the following data.

<b>LF</b>	.13	.13	.13	.13	.13	.13	.10	.10	.10	.10	.10
<b>OD</b>	2.25	2.63	3.00	3.38	3.75	4.38	5.13	5.63	6.25	7.00	7.50
<b>MM</b>	.625	1.000	1.375	1.750	2.000	2.500	3.000	3.500	4.000	5.000	5.500

To determine extra length of piston rod required to accommodate boot, calculate  
 $BL = Stroke \times LF + 1.13"$

$BL + Std. W$  or  $WF + A$  = length of piston rod to extend beyond the retainer.

NOTE: Check all Boot O.D's against std. "E" dimension from catalog. This may be critical on foot mounted cylinders.

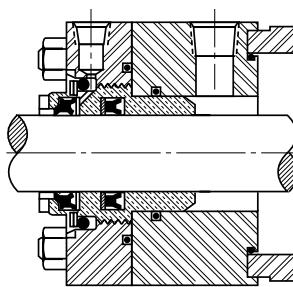

**Bushing Drain**

Hydraulic fluids tend to adhere to the piston rods, during the extend stroke, and an accumulation of fluid can collect in the cavity behind the bushing wiperseal on long stroke cylinders.

A  $1/8"$  NPTF bushing drain port can be provided in the bushing retainer. A passage in the bushing between the wiperseal and lipseal is provided to drain off any accumulation of fluid between the seals. See drawing below.

It is recommended that the bushing drain port be piped back to the fluid reservoir and that the reservoir be located below the level of the head of the cylinder.

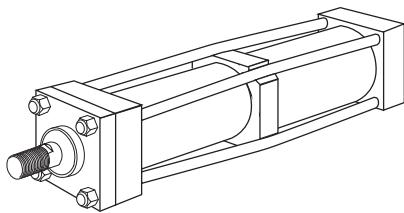

On 1.50" bore with 0.625" rod the drain port is located in the head adjacent to the port. The retainer thickness

on 1.50" bore with 1.000" rod and bushing drain is increased to 0.63". On 2.00"-8.00" bore sizes the drain port is located in the retainer as shown. On Style JJ with bushing drain, the drain port is in the head.

**Air Bleeds**

In most hydraulic circuits, cylinders are considered self-bleeding when cycled full stroke. If air bleeds are required and specified,  $1/8"$  NPTF Air Bleed Ports for venting air can be provided at both ends of the cylinder body, or on the head or cap. To order, specify "Bleed Port", and indicate position desired.

**Common & Custom Modifications****Tie Rod Supports**

**Rigidity of Envelope** – Atlas heavy duty hydraulic cylinders have advantages in rigidity within the limits of the cylinder tube to resist buckling. For long stroke tie rod cylinders, within practical limits, Atlas provides Tie Rod Supports (see table below) that move the tie rod centerlines radially outward.

Standard tie rod supports are kept within the envelope dimensions of the head and cap, and generally do not interfere with mounting a long cylinder.

Number of Supports Required	Bore $\varnothing$	Stroke (Inches)										
		36	48	60	72	84	96	108	120	132	144	
	1.50	—	—	1	1	1	2	2	2	3	3	4
	2.00	—	—	—	1	1	1	1	2	2	2	3
	2.50	—	—	—	—	1	1	1	1	1	2	2
	3.25	—	—	—	—	—	—	1	1	1	1	1
	4.00	—	—	—	—	—	—	—	—	1	1	1

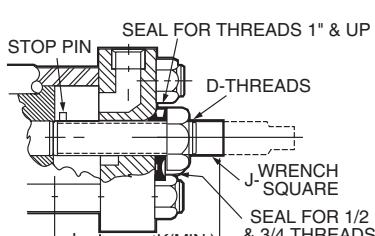

Note: 5.00" through 14.00" bore sizes — no supports required.

**Stroke Adjusters**

For the requirement where adjusting the stroke is specified. Atlas has several designs to offer, one of which is illustrated below. This is suitable for infrequent adjustment and is economical<sup>1</sup>.

Bore $\varnothing$	D	J	K	L (Max.)
1.50	1/2 - 20	0.31	0.94	5
2.00	3/4 - 16	0.44	1.25	8
2.50, 3.25	1 - 14	0.63	1.69	9
4.00	1 1/2 - 12	0.94	2.13	18
5.00	2 - 12	0.94	2.69	20

8.00	3 1/2 - 12	2.38	3.50	20

Here a "retracting stroke adjuster" must be called for in specifications, and the length of the adjustment must be specified.

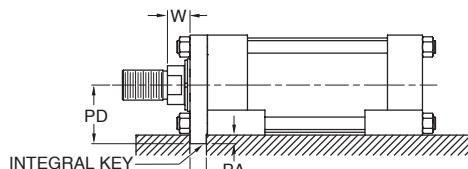

Where frequent adjustment or cushions at the cap end are required, other designs are available according to application needs.

<sup>1</sup> Infrequent is defined by positioning the retract stroke in a couple of attempts at original machine set up. The frequent stroke adjuster is recommended for adjustments required after the original equipment has been adjusted by the original machine manufacturer.

**Heavy Duty Hydraulic Cylinders****H Series****Thrust Key Mountings**

Thrust key mountings eliminate the need of using fitted bolts or external keys on side mounted cylinders.

Atlas cylinders in mounting styles CP and FP can be provided with the bushing retainer plate extended below the mounting side of the cylinder (see illustration below). This extended retainer plate can then be fitted into a keyway milled into the mounting surface of the machine member. This is referred to as the "P" Modification of any side mounting style.

**General Formula**

The cylinder output forces are derived from the formula:

$$F = P \times A$$

Where F = Force in pounds.

P = Pressure at the cylinder in  
pounds per square inch, gauge.

A = Effective area of cylinder piston  
in square inches.

**Theoretical Pull Forces for Hydraulic Cylinders**

**Global Shield™ Rod Coating Technology****A Dramatically Different Approach to Resisting Corrosion**

Atlas's **Global Shield** rod coating technology is specifically designed to address corrosion resistance requirements of challenging industrial applications. When compared to traditional rod coatings, **Global Shield** has the following advantages:

- **Significantly Improved Corrosion Resistance** from the single-layer, fully dense, submicron structure and the lack of micro cracks inherent to chrome plating.
- **Lower Friction**
- **Ductile and Tough** so when the rod bends, it does too
- **Engineered Hardness** (HRC 54 minimum) for wear-resistance

The **value** that you will receive from **Global Shield** includes:

- **Less Downtime** from reduced maintenance intervals (cylinder repairs and seal replacements)
- **Longer Seal Life** in corrosive environments
- **Lower Service Costs** since you won't need to replace the piston rod due to corrosion

**Performance Validated in the Lab and in the field**

This breakthrough proprietary technology, owned and manufactured by Parker Hannifin Corporation, has been thoroughly tested in the lab and in the field to validate performance in the areas of corrosion and dynamic wear resistance. Cylinders protected with Atlas's Global Shield

coating have demonstrated resistance to corrosion up to 8x longer than conventional coatings. Tests also confirm leak-free performance even after 1 million cycles and 2,000 hours of salt spray.

**Availability**

- Rod diameters from  $\frac{1}{2}$ " to 15"
- Rod lengths to 13 feet
- Standard thickness – 0.001"  
*Up to 0.020" available; corrosion protection increases as the thickness increases*
- Standard substrate – 1045/1050 carbon steel  
*Other substrates available*

**How to Order**

Enter an 'S' in the Special Modifications field of the model number and specify Global Shield Piston Rod Coating. Unless otherwise specified, standard 0.001" thickness will be supplied.

For additional Global Shield information see Bulletin HY08-0896.

**Cylinder Weights**

The weights shown below are for standard Series H hydraulic cylinders equipped with various diameter piston rods. To determine the net weights of a cylinder, first select the proper basic weight for zero stroke, then calculate the weight of the cylinder stroke and add the result to the basic weight. For extra rod extension use

**Heavy Duty Hydraulic Cylinders  
H Series**

piston rod weights per inch shown in Table C. Weights of cylinders with intermediate rods may be estimated from table below by taking the difference between the piston rod weights per inch and adding it to the Code 1 weight for the cylinder bore size involved.

**Table A** Cylinder Weights, in pounds, for Series H (7.00" & 8.00") hydraulic cylinders

## Operating Fluids and Seals / Temperature

### Operating Fluids and Temperature Range

Fluidpower cylinders are designed for use with pressurized air, hydraulic oil and fire resistant fluids, in some cases special seals are required.

### Class 1 – Standard Seals

Class 1 seals are intended for use with fluids such as: air, nitrogen, mineral base hydraulic oil or MIL-H-5606 within the temperature range of -10°F (-23°C) to +165°F (+74°C). Generally they are nitrile except for piston rod seals in hydraulic cylinders. However the individual seals may be nitrile (Buna-N) enhanced polyurethane, polymyte, PTFE or filled PTFE.

### Class 2 – Water Base Fluid Seals

Generally class 2 seals are intended for use with water base fluids within the temperature of -10°F (-23°C) to +165°F (+74°C) except for High Water Content Fluids (HWCF) in which case Class 6 seals should be used. Typical water base fluids are: Water, Water-Glycol, Water-in-Oil Emulsion, Houghto-Safe 27, 620, 5040, Mobil Pyrogard D, Shell Iris 905, Ucon Hydrolube J-4. These seals are nitrile.

### Class 3 – Ethylene Propylene (EPR) Seals

Class 3 seals are intended for use with some Phosphate Ester Fluids between the temperatures of -10°F (-23°C) to +130°F (+54°C). Typical fluids compatible with EPR seals are Skydrol 500 and 700. EPR are Ethylene Propylene. Note: EPR seals are not compatible with mineral base hydraulic oil or greases. Even limited exposure to these fluids will cause severe swelling.

### Class 4 – Low Temperature Nitrile Seals

Class 4 seals are intended for low temperature service with the same type of fluids as used with Class 1 seals within the temperature range of -50°F (-46°C) to +150°F (+66°C). Note: Certain fluids may react adversely with Class 4 seals compared to Class 1 seals.

### Class 5 – Fluorocarbon (FKM) Seals

Class 5 seals are intended for elevated temperature service or for some Phosphate Ester Fluids such as Houghto-Safe 1010, 1055, 1120; Fyrgel 150, 220, 300, 350; Mobile Pyrogard 42, 43, 53, and 55. However, they are not compatible with Phosphate Ester Fluids such as Skydrols. Class 5 seals can operate with a temperature range of -10°F (-23°C) to +300°F (+149°C). For temperatures above +250°F (+121°C) the cylinder must be manufactured with non-studded piston rod and a pinned piston to rod connection.

### Class E – Fluorocarbon piston rod bushing seals only

Intended for applications where only the rod bushing is exposed to fluids or temperatures needing fluorocarbon compatibility.

### Class 6 – HWCF Seals

Class 6 seals are intended for High Water Content Fluids (HWCF) such as Houghton, Hydrolubric 120B and Sonsol Lubrizol within the

## Heavy Duty Hydraulic Cylinders H Series

temperature range of +40°F (+4°C) to +120°F (+49°C). Class 6 seals are special nitrile compound dynamic seals. Because of the viscosity of these fluids, cylinders specified with class 6 seals, will also be modified to have straight cushions.

### Class 8 – High Temperature Seals

Class 8 seals consist of filled PTFE piston seal, rod seals and wiperseal. They are intended for high temperature applications, to 400°F (204°C), where longer seal life and improved high temperature sealing performance is required. Minimum operating temperature is -15°F (-26°C). Body and bushing o-ring seals will be fluorocarbon. Fluid resistance is comparable to Class 5. Cylinders incorporating Class 8 Seals will not have studded piston rods.

**Class N – Class 8 piston rod bushing seals only – all other seals are fluorocarbon** Intended for applications where only the rod bushing is exposed to fluids or temperatures needing filled PTFE seal compatibility.

### Warning △

The piston rod stud and the piston rod to piston threaded connections are secured with an anaerobic adhesive which is temperature sensitive. Cylinders are assembled with anaerobic adhesive having a maximum temperature rating of +250°F (+121°C). Cylinders specified with all other seal compounds (built before 1997) were assembled with anaerobic adhesive having a maximum operating temperature rating +165°F (+74°C). These temperature limitations are necessary to prevent the possible loosening of the threaded connections. Cylinders originally manufactured (before 1997) with class 1 seals (Nitrile) that will be exposed to ambient temperatures above +165°F (+74°C) must be modified for higher temperature service. Contact the factory immediately and arrange for the piston to rod and the stud to piston rod connections to be properly re-assembled to withstand the higher temperature service.

### Water Service

Series H cylinders can be modified to make them more suitable for use with water as the operating medium. The modifications include chrome-plated cylinder bore; electroless nickel-plated head, cap and piston; chrome-plated 17-4 stainless steel piston rod; chrome plated cushion sleeve or cushion spear. Water and high water base fluid operated cylinders are best used on short stroke applications or where high pressure is applied only to clamp the load.

### Warranty

Parker Hannifin will warrant cylinders modified for water or high water content fluid service to be free of defects in materials or workmanship, but cannot accept responsibility to premature failure due to excessive wear due to lack of lubricity or where failure is caused by corrosion, electrolysis or mineral deposits within the cylinder.

**Fluids and Temperature Range**

Class No.	Typical Fluids	Temperature Range
1 (Standard) (Nitrile Polyurethane)	Air, Nitrogen Hydraulic Oil, Mil-H-5606 Oil	-10°F (-23°C) to +165°F (+74°C)
2 Optional Water Base Fluid Seal	Water, Water-Glycol, HWCF — See Class 6 below. Water-in-Oil Emulsion Houghto-Safe, 271, 620, 5040. Mobil Pyrogard D, Shell Irlus 905. Ucon Hydrolube J-4	-10°F (-23°C) to +165°F (+74°C)
3 Special (EPR) (at extra cost)	Some Phosphate Ester Fluids Skydrol 500, 7000	-10°F (-23°C) to +130°F (+54°C)
Note: (EPR) seals are not compatible with Hydraulic Oil		
4 Special (Nitrile) (at extra cost)	Low Temperature Air or Hydraulic Oil	-50°F (-46°C) to +150°F (+66°C)
5 Optional (at extra cost) (Fluorocarbon Seals)	High Temperature Houghto-Safe 1010, 1055, 1120 Fyrquel 150, 220, 300, 550 Mobil Pyrogard 42,43,53,55	See paragraph on Fluorocarbon seals for recommended temperature range.
Note: Fluorocarbon seals are not suitable for use with Skydrol fluid, but can be used with hydraulic oil if desired.		
6 Optional (HWCF) (at extra cost)	Houghton, Hydrolubric 120B Sonsol Lubrizol, for other HWCF — consult factory.	+40°F (+4°C) to +120°F (+49°C)
8 Optional (at extra cost) Energized PTFE	See Class 5 Seals	-15°F (-26°C) to +400°F (+204°C)

**Application Data**

The proper application of a fluid power cylinder requires consideration of the operating pressure, the fluid medium, the mounting style, the length of stroke, the type of piston rod connection to the load, thrust or

tension loading on the rod, mounting attitude, the speed of stroke, and how the load in motion will be stopped. Information given here provides pressure rating data for hydraulic cylinders.

**Pressure Ratings**

Standard operating fluid — clean, filtered hydraulic oil. Pressure ratings for heavy-duty hydraulic cylinders are shown in the table.

Series H hydraulic cylinders are recommended for pressures to 3000 psi for heavy-duty service with hydraulic oil. The 4:1 design factor ratings shown are based on tensile strength of material and are for standard rod diameter only. The rating is conservative for continuous severe applications. Design factors at other pressures can be calculated from this rating. In addition, mounting styles, stroke, etc., should be considered because of the limiting effect they may have on these ratings.

**Series H Hydraulic Cylinders  
Maximum Pressure Ratings**

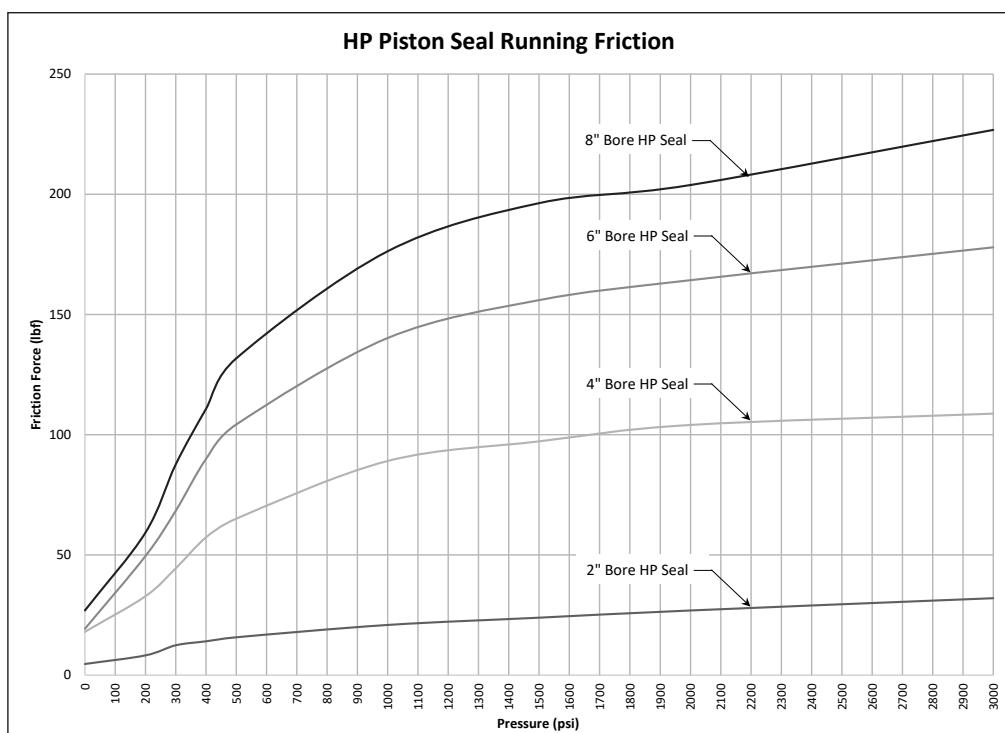

Bore Ø	Rod Ø	4:1 <sup>1</sup> Design Factor (Tensile) (psi)	Heavy-Duty Service (psi)
1.50	0.625	2530	3000
2.00	1.000	2950	3000
2.50	1.000	2340	3000
3.25	1.375	2250	3000
4.00	1.750	2130	3000
5.00	2.000	2170	3000
6.00	2.500	2270	3000
7.00	3.000	2030	3000
8.00	3.500	2040	3000
10.00	4.500	2720	3000
12.00	5.500	2580	3000
14.00	7.000	2320	3000
16.00	8.000	2750	3000
18.00	9.000	2900	3000
20.00	10.000	2640	3000

<sup>1</sup> Applies to all mountings except Styles J, JB and H.

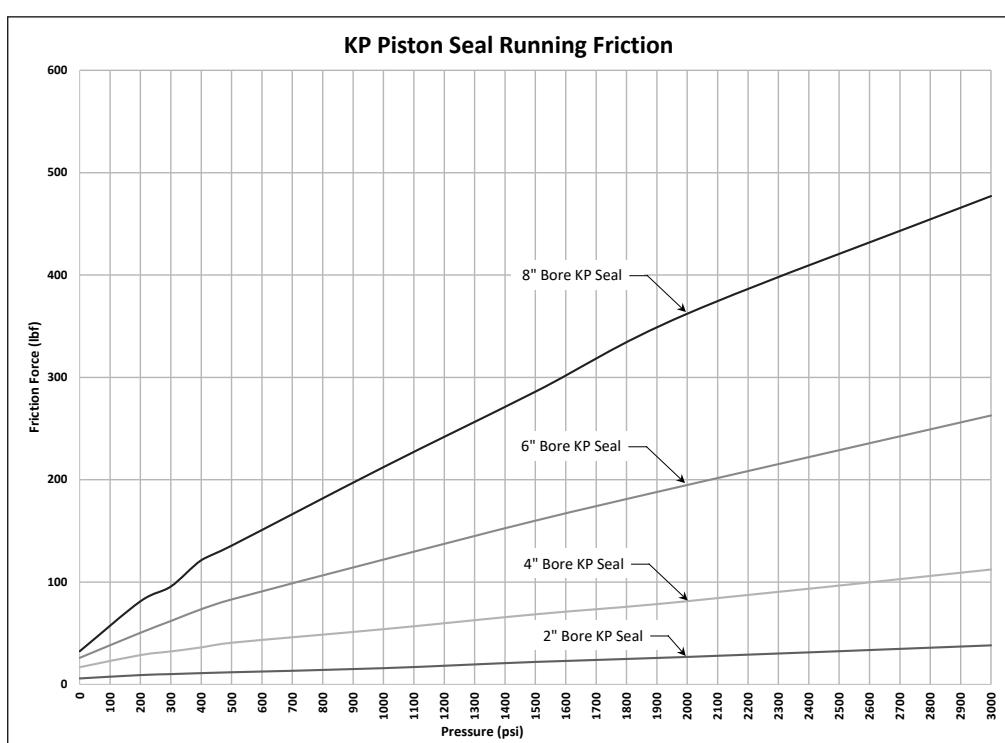

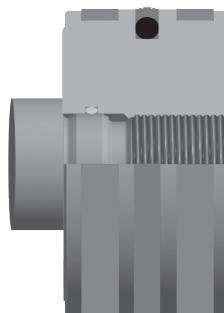

**Piston Friction**

Atlas's new universal piston design provides not only superior sealing and wear performance, but also conserves operating energy with reduced running friction when compared to traditional sealing technologies. Running friction test results for the most

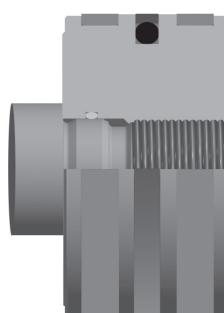

popular seal configurations, HP Polyurethane Piston Seal and KP filled PTFE Piston Seal in 2.00", 4.00", 6.00" and 8.00" bores are shown in graphs below. Friction for intermediate bore sizes can be estimated using curves for bore sizes tested.

**Atlas HP  
Polyurethane  
Piston Seal**

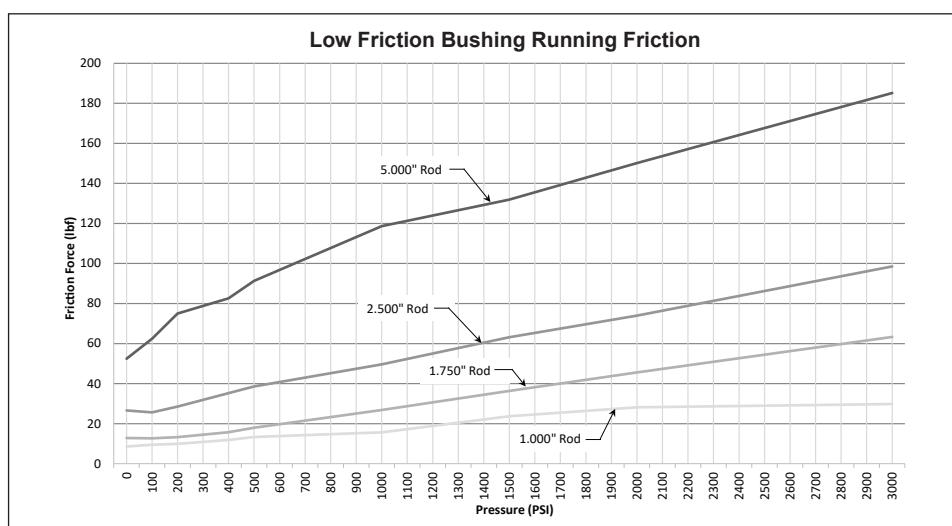

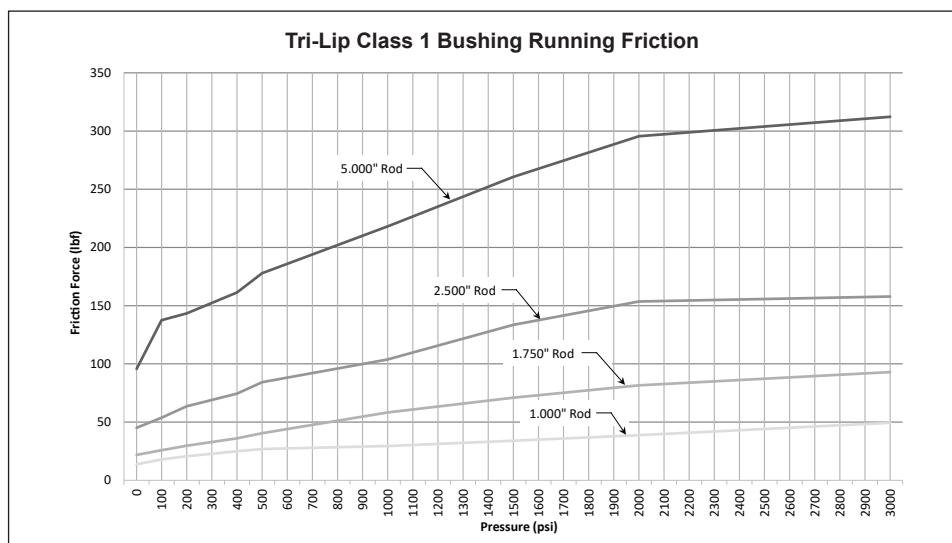

**Atlas KP Filled  
PTFE Piston Seal**

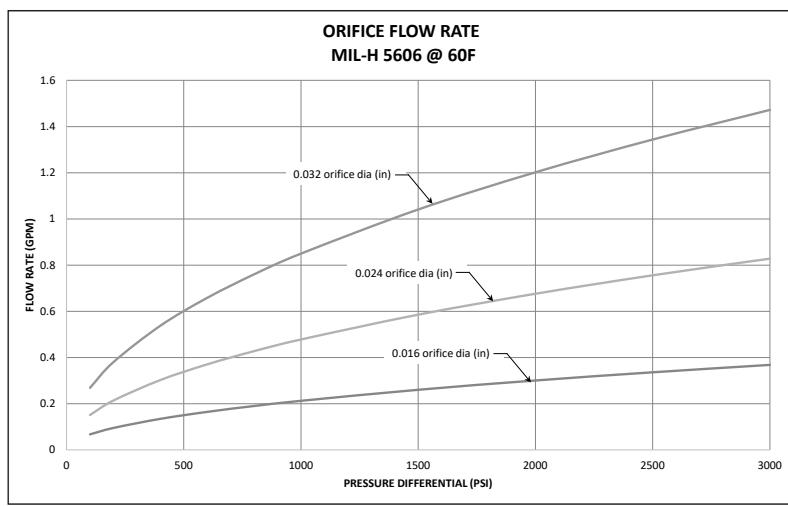

**Bushing Friction**

Bushing friction is also a factor in cylinder operating efficiency and combined with piston seal friction will yield an overall cylinder running friction value. Running friction test results for H (Tri-Lip) and Low Friction bushings in

1.000", 1.750", 2.500" and 5.000" piston rod diameters are shown in the graphs below. Friction for intermediate rod diameters can be estimated using curves for bore sizes tested.

**Piston Orifice**

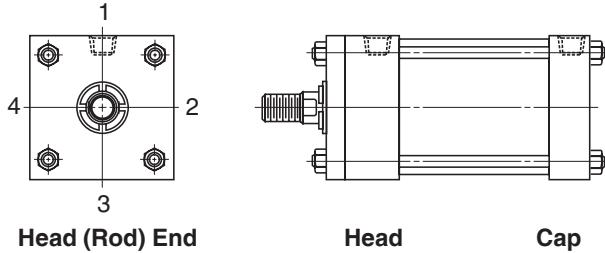

Atlas's RP Thermoplastic piston seal is fully extrusion resistant and the choice for applications formerly served by cast iron rings. For some applications, cast iron rings are selected because of the inherent piston bypass. Where bypass is required for the RP seal (or any other universal piston seal style), a piston orifice option is available. There are three orifice diameters to choose from, 0.016", 0.024" and 0.032". Flow charts at right detail the bypass flow at various pressures for each orifice. Specify the orifice by placing an 'S' in the Special Modification field of the model number and describe the orifice as in the following example: S = 0.024" Piston Orifice (insert desired orifice dia). Piston orifice not available in bores 1.50", 2.00" and 2.50" with rod codes 2 & 3.

**Ports****Ports**

Series H cylinders can be supplied with SAE straight O-ring ports or NPTF pipe thread ports. If specified on your order, extra ports can be provided on the sides of heads or caps that are not occupied by mountings or cushion valve.

Standard port location is position 1 as shown on line drawings in product catalog and Figure 1 below. Cushion adjustment needle and check valves are at positions 2 and 4 (or 3), depending on mounting style. Heads or caps which do not have an integral mounting can be rotated and assembled with ports at 90° or 180° from standard position. Mounting styles on which head or cap can be rotated at no extra charge are shown in Table A below. To order, specify by position number. In such assemblies the cushion adjustment needle and check valve rotate accordingly since their relationship with port position does not change.

**Figure 1****Table A**

Mounting Style	Port Position Available	
	Head End	Cap End
TB, TC, TD, J, H, JB, HB, DD, DE	1, 2, 3 or 4	1, 2, 3 or 4
HH, DB, BB, SB, SE	1, 2, 3 or 4	1 or 3
JJ, D	1 or 3	1, 2, 3 or 4
C, F	1	1

Ports can be supplied at positions other than those shown in Table A at an extra charge. To order, specify port position as shown in Figure 1.

**Straight Thread Ports**

The SAE straight thread O-ring port is recommended for hydraulic applications. Atlas will furnish this port configuration at positions shown in Table A. This port can also be provided at positions other than those shown in Table A at an extra charge. SAE port size numbers are listed next to the NPTF pipe thread counterparts for each bore size in the respective product catalogs. Size number, tube O.D., and port thread size for SAE ports are listed in Table B.

**Heavy Duty Hydraulic Cylinders  
H Series****Table B — SAE Straight Thread O-Ring Ports**

Size No.	Tube O.D. (In.)	Thread Size	Size No.	Tube O.D. (In.)	Thread Size
2	0.13	5/16 - 24	12	0.75	1 1/16 - 12
3	0.19	3/8 - 24	—	—	—
4	0.25	7/16 - 20	16	1.00	1 5/16 - 12
5	0.31	1/2 - 20	20	1.25	1 5/8 - 12
6	0.38	9/16 - 18	24	1.50	1 7/8 - 12
8	0.50	3/4 - 16	32	2.00	2 1/2 - 12
10	0.63	7/8 - 14	—	—	—

**Note:** For the pressure ratings of individual connectors, contact your connector supplier. Hydraulic cylinders applied with meter out or deceleration circuits are subject to intensified pressure at the cylinder piston rod end. The rod end pressure is approximately equal to:

$$\frac{\text{Effective Cap End Piston Area}}{\text{Effective Rod End Piston Area}} \times \text{Operating Pressure}$$

**International Ports**

Other port configurations to meet international requirements are available at extra cost. Atlas Series H cylinders can be supplied, on request, with British standard taper port (BSPT). Such port has a taper of 1 in 16 measured on the diameter ( $1/16$ " per inch). The thread form is Whitworth System, and size and number of threads per inch are as follows:

**Table C — British Standard Pipe Threads**

Nominal Pipe Size	No. Threads Per Inch	Pipe O.D.
1/8	28	0.383
1/4	19	0.518
3/8	19	0.656
1/2	14	0.825
5/8	14	1.041
1	11	1.309
1 1/4	11	1.650
1 1/2	11	1.882
2	11	2.347

British standard parallel internal threads are designated as BSPP and have the same thread form and number of threads per inch as the BSPT type and can be supplied, on request, at extra cost. Unless otherwise specified, the BSPP or BSPT port size supplied will be the same nominal pipe size as the NPTF port for a given bore size cylinder.

Metric ports can also be supplied to order at extra cost. See table below for standard port size for each bore.

**Table D — Standard Port Sizes**

Bore Ø	T SAE	U NPTF	P SAE Code 61 Flange	Y ISO 6149	B BSPT R BSPP	G Metric

16.00-20.00	24	-	3	-	-	-

<sup>1</sup>Available with 1.000 inch rod diameter only.

**Ports****Oversize Ports**

Oversize NPTF or SAE straight thread ports can be provided, at an extra charge. For ports one size larger than standard, welded port bosses which protrude from the side of the head or cap are supplied. For dimensions, see drawings and tables below. Series H cylinders equipped with cushions at the cylinder cap end can sustain damage to the cushion check valve (cushion bushing) if excessive oil flow enters the cylinder from the cap end port. Cylinders which are equipped with cap end cushions and ordered with one size oversize ports having hydraulic fluid velocity exceeding 25 ft./sec. in the line entering the cap end of the cylinder should be ordered with a "solid cushion" at cap end. All cylinders ordered with

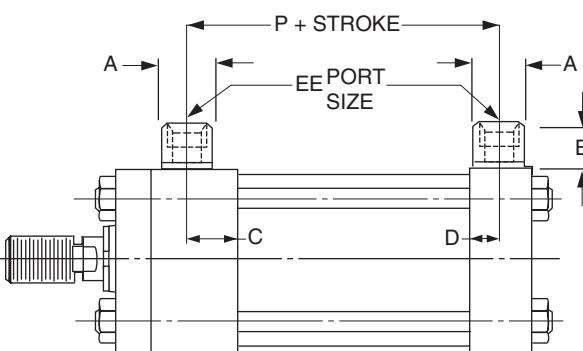

**Heavy Duty Hydraulic Cylinders  
H Series**

double oversize ports should always be ordered with a "solid cushion" at cap end.

Cylinders which are connected to a meter out flow control with flow entering the cap end of a cylinder provided by an accumulator may also experience damage to the cushion bushing due to high instantaneous fluid flows. This condition can be eliminated by using a meter in flow control or "solid cushions" at cap end.

**Oversize NPTF Port Boss Dimensions**

## Stroke Data / Mounting Groups

### Stroke Data

Atlas cylinders are available in any practical stroke length. The following information should prove helpful to you in selecting the proper stroke for your cylinder application.

### Stroke Tolerances

Stroke length tolerances are required due to buildup of tolerances of piston, head, cap and cylinder tube. Standard production of stroke tolerances run +.031" to

### Mounting Groups

Standard mountings for fluid power cylinders fall into three basic groups. The groups can be summarized as follows:

**Group 1** Straight Line Force Transfer with fixed mounts which absorb force on cylinder centerline.

**Group 2** Pivot Force Transfer. Pivot mountings permit a cylinder to change its alignment in one plane.

**Group 3** Straight Line Force Transfer with fixed mounts which do not absorb force on cylinder centerline.

Because a cylinder's mounting directly affects the maximum pressure at which the cylinder can be used, the chart below should be helpful in selection of the proper mounting combination for your application.

Stroke length, piston rod connection to load, extra piston rod length over standard, etc., should be considered for thrust loads. Alloy steel mounting bolts are recommended for all mounting styles, and thrust keys are recommended for Styles C and F.

### Double Rod End Cylinders

The piston connection to rod #1 (without 'V' notch) of 1.50"-8.00" bore double rod end heavy duty hydraulic cylinders is pre-stressed for maximum fatigue life. For this reason the load should always be attached to the rod without 'V' notch. Extension rod #2 with 'V' notch is threaded to rod #1 and is recommended for non-load bearing attachment only.

For thrust (compression) load applications where the mounting style end of a double rod end cylinder is opposite the rod connected to the load it should be specified as a cap mounting style. For example, a head trunnion mounting style opposite the rod connected to the load should be specified as DB. This will ensure that the rod end without 'V' notch will be oriented opposite the head trunnion end. See the table below for guidance in selecting mounting styles that fit this criteria.

### Double Rod End Mounting Styles

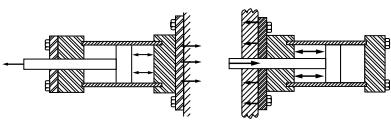

Mounting Styles for Single Rod Models	Mounting Styles for Corresponding Double Rod Models with the Load Connected To Rod Opposite Cylinder Mounting End
TB	KTC
J	KH
JB	KHB
JJ	KHH
D	KDB

## Heavy Duty Hydraulic Cylinders

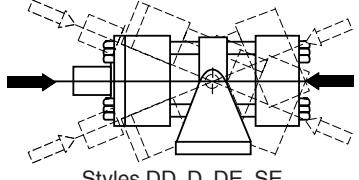

### H Series

-.015" up to 20" stroke, +.031" to -.020" for 21" to 60" and +.031" to -.031" for greater than 60" stroke. For closer tolerances on stroke length, it is necessary to specify the required tolerance plus the pressure and temperature at which the cylinder will operate. Stroke tolerances smaller than .015" are not generally practical due to elasticity of cylinders. If machine design requires such close tolerances, use of a stroke adjuster may achieve the desired result.

### Double Rod Cylinder

#### Style K

**Stop Tubing****Stop Tubing**

Stop tube is recommended to lengthen the distance between the rod bearing and piston bearing to reduce bearing loads on long push stroke cylinders when the cylinder is fully extended. This is especially true of horizontally mounted cylinders. As part of the piston assembly and positioned between the piston and head, a stop tube restricts the extended position of the rod using the increased distance to achieve additional stability.

Use the following steps to determine the need for stop tube and, if required, how long it should be.

1. Examine the groups of cylinder illustrations below and determine which mounting and rod guiding group type match the required cylinder application.

**Stop Tube Length vs Basic Length (L)**

Pivot Mounts (BB, D, DB, DD, DE, SB and SE)		Fixed Mounts (C, F, H, HB, HH, J, JB, JJ, TB, TC, TD)					
Pivoted and Rigidly Guided Rod End		Fixed & Rigidly Guided Rod End		Pivoted & Rigidly Guided Rod End		Unguided Rod End	
Basic Length (L)	Stop Tube Length	Basic Length (L)	Stop Tube Length	Basic Length (L)	Stop Tube Length	Basic Length (L)	Stop Tube Length

**Heavy Duty Hydraulic Cylinders****H Series**

2. Establish the Basic Length (L), with the piston rod fully extended, for the selected illustration by using the dimensional tables on previous pages of this catalog. For pivot mounted cylinders, the pin-to-pin dimension with the piston rod fully extended must be used. Regardless of mounting style, be sure to include any extended piston rod length beyond the catalog standard.

3. In the Stop Tube Table select the column for the appropriate mounting style and rod end guiding type. In the Basic Length (L) column, find the row with the range that includes the value calculated in Step 2. The next respective column to the right has the required length of stop tube.

**Note:** Mounting Styles BB, DB, H, HB, HH, SB and SE are mounted horizontally should also be checked for turning moments and loads between the rod bearing and piston to ensure they are not excessive. Weight of oil must be included in determining bearing loads.

When specifying cylinders with stop tube be sure to call out the net stroke and the length of the stop tube. Machine design can be continued without delay by laying in a cylinder equivalent in length to the NET STROKE PLUS STOP TUBE LENGTH, which is referred to as GROSS STROKE.

**Cylinder Mounting and Rod Guiding Groups**

Pivot Mount – Pivoted and rigidly guided rod end

<sup>1</sup> Maximum operating pressure is limited for Mounting Style SB. Please refer to maximum operating pressure per bore in Pressure Ratings table located on the dimension page for Mounting Styles SB.

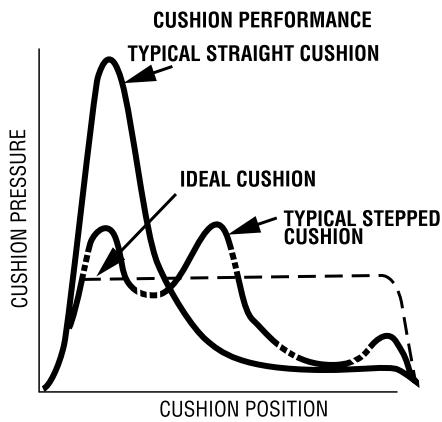

## Cushioning

### An Introduction to Cushioning

Cushioning is recommended as a means of controlling the deceleration of masses, or for applications where piston speed is in excess of 4 in/sec and the piston will make full stroke. Cushioning extends cylinder life and reduces undesirable noise and hydraulic shock. Built-in "cushions" are optional and can be supplied at the head and cap ends of a cylinder without affecting its envelope or mounting dimensions.

### Standard Cushioning

**Ideal cushion performance shows an almost uniform** absorption of energy along the cushioning length, as shown. Many forms of cushioning exist, and each has its own specific merits and advantages.

cushion performance for each of the rod sizes available is illustrated graphically in the charts on the following pages.

Note: Cushion performance will be affected by the use of water or high water based fluids. Please consult factory for details.

### Cushion Length

Where specified, H cylinders incorporate the longest cushion sleeve and spear that can be accommodated within the standard envelope without reducing the rod bearing and piston bearing length. See cushion lengths on the next page. Cushions are adjustable via recessed needle valves.

### Cushion Calculation

The charts on the cushion energy absorption capacity data page show the energy absorption capacity for each bore/rod combination at the head (annulus) and the cap (full bore) ends of cylinder. The charts are valid for piston velocities within a range of 0.33 to 1 ft/s. For velocities between 1ft/s and 1.64 ft/s the energy values derived from the charts should be reduced by 25%. For velocities less than 0.33 ft/s where large masses are involved, and for velocities greater than 1.60 ft/s, a special cushion profile may be required. Please consult the factory for details.

The cushion capacity of the head end is less than the cap, and reduces to zero at high drive pressures due to the pressure intensification effect across the piston.

The energy absorption capacity of the cushion decreases with drive pressure.

## Heavy Duty Hydraulic Cylinders

### H Series

#### Formula

Cushioning calculations are based on the formula  $E = (1/2)mv^2 + mg(L/12) \times \sin(a)$  for horizontal applications. For inclined or vertically downward or upward applications, this is modified to:

$$E = (1/2)mv^2 + mg(L/12) \times \sin(a) \quad (\text{for inclined or vertically downward direction of mass})$$

$$E = (1/2)mv^2 - mg(L/12) \times \sin(a) \quad (\text{for inclined vertically upward direction of mass})$$

where:

$E$  = energy absorbed in ft-lb

$g$  = acceleration due to gravity = 32.2 ft/s<sup>2</sup>

$v$  = velocity in ft/s

$L$  = length of cushion in inches (see cushion length chart on the next page).

$m$  = mass of load in slug (including piston, rod and rod end accessories).

$a$  = angle to the horizontal in degrees

$p$  = pressure in psi

#### Example:

The following example shows how to calculate the energy developed by masses moving in a straight line. For non-linear motion, other calculations are required; please consult the factory. The example assumes that the bore and rod diameter are already appropriate for the application. The effects of friction on the cylinder and load have been ignored.

Selected bore/rod 6.00" bore x 2.50" rod (No. 1 rod)

Cushion at the cap end.

Pressure = 2,500 psi

Mass = 685 slugs = weight in lb / (32.2 ft/s<sup>2</sup>)

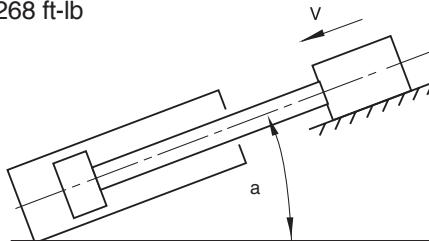

Velocity = 1.3 ft/s

Cushion length = 1.313 inch

$a$  = 45°

$\sin(a) = 0.70$

$$\begin{aligned} E &= (1/2)mv^2 + mgl/12 \times \sin(a) \\ &= (1/2) \times 685 \times 1.3^2 + 685 \times 32.2 \times 1.313/12 \times 0.70 \\ &= 2,268 \text{ ft-lb} \end{aligned}$$

Note: In the above example velocity is greater than 1 ft/s. Therefore, a de-rating factor of 0.75 must be applied to the calculated value of  $E$ . Applying this correction factor will increase the energy value to 3024 ft-lb ( $2268/0.75 = 3024$  ft-lb). A review of the graph for the cap end cushion of a 6 inch bore x 2.50" rod cylinder operating at 2500 psi indicates that it can absorb approximately 3200 ft-lb maximum of energy. Since 3024 ft-lb is less than the maximum allowable of 3200 ft-lb, the cylinder can be applied as indicated. If the calculated energy exceeds the value shown on the curve, select a larger bore cylinder and/or reduce the operating pressure and recalculate the energy. Compare the newly calculated energy value to the appropriate curve to ensure it does not exceed the maximum allowable energy.

**Safety Guide for Selecting and Using Hydraulic, Pneumatic Cylinders and Their Accessories**

**WARNING:  FAILURE OF THE CYLINDER, ITS PARTS, ITS MOUNTING, ITS CONNECTIONS TO OTHER OBJECTS, OR ITS CONTROLS CAN RESULT IN:**

- Unanticipated or uncontrolled movement of the cylinder or objects connected to it.
- Falling of the cylinder or objects held up by it.
- Fluid escaping from the cylinder, potentially at high velocity.

**THESE EVENTS COULD CAUSE DEATH OR PERSONAL INJURY BY, FOR EXAMPLE, PERSONS FALLING FROM HIGH LOCATIONS, BEING CRUSHED OR STRUCK BY HEAVY OR FAST MOVING OBJECTS, BEING PUSHED INTO DANGEROUS EQUIPMENT OR SITUATIONS, OR SLIPPING ON ESCAPED FLUID.**

Before selecting or using Parker Hannifin Corporation (the Company) cylinders or related accessories, it is important that you read, understand and follow the following safety information. Training is advised before selecting and using the Company's products.

**1.0 General Instructions**

**1.1 Scope** – This safety guide provides instructions for selecting and using (including assembling, installing, and maintaining) cylinder products. This safety guide is a supplement to and is to be used with the specific Company publications for the specific cylinder products that are being considered for use.

**1.2 Fail Safe** – Cylinder products can and do fail without warning for many reasons. All systems and equipment should be designed in a fail-safe mode so that if the failure of a cylinder product occurs people and property won't be endangered.

**1.3 Distribution** – Provide a free copy of this safety guide to each person responsible for selecting or using cylinder products. Do not select or use the Company's cylinders without thoroughly reading and understanding this safety guide as well as the specific Company publications for the products considered or selected.

**1.4 User Responsibility** – Due to very wide variety of cylinder applications and cylinder operating conditions, the Company does not warrant that any particular cylinder is suitable for any specific application. This safety guide does not analyze all technical parameters that must be considered in selecting a product. The hydraulic and pneumatic cylinders outlined in this catalog are designed to the Company's design guidelines and do not necessarily meet the design guideline of other agencies such as American Bureau of Shipping, ASME Pressure Vessel Code etc. The user, through its own analysis and testing, is solely responsible for:

- Making the final selection of the cylinders and related accessories.
- Determining if the cylinders are required to meet specific design requirements as required by the Agency(s) or industry standards covering the design of the user's equipment.
- Assuring that the user's requirements are met, OSHA requirements are met, and safety guidelines from the applicable agencies such as but not limited to ANSI are followed and that the use presents no health or safety hazards.
- Providing all appropriate health and safety warnings on the equipment on which the cylinders are used.

**1.5 Additional Questions** – Call the appropriate Company technical service department if you have any questions or require any additional information. See the Company publication for the product being considered or used, or call 1-847-298-2400, or go to [www.parker.com](http://www.parker.com), for telephone numbers of the appropriate technical service department.

**2.0 Cylinder and Accessories Selection**

**2.1 Seals** – Part of the process of selecting a cylinder is the selection of seal compounds. Before making this selection, consult the "seal information page(s)" of the publication for the series of cylinders of interest.

The application of cylinders may allow fluids such as cutting fluids, wash down fluids etc. to come in contact with the external area of the cylinder. These fluids may attack the piston rod wiper and/or the primary seal and must be taken into account when selecting and specifying seal compounds.

Dynamic seals will wear. The rate of wear will depend on many operating factors. Wear can be rapid if a cylinder is mis-aligned or if the cylinder has been improperly serviced. The user must take seal wear into consideration in the application of cylinders.

**2.2 Piston Rods** – Possible consequences of piston rod failure or separation of the piston rod from the piston include, but are not limited to are:

- Piston rod and/or attached load thrown off at high speed.
- High velocity fluid discharge.
- Piston rod extending when pressure is applied in the piston retract mode.

Piston rods or machine members attached to the piston rod may move suddenly and without warning as a consequence of other conditions occurring to the machine such as, but not limited to:

- Unexpected detachment of the machine member from the piston rod.

- Failure of the pressurized fluid delivery system (hoses, fittings, valves, pumps, compressors) which maintain cylinder position.
- Catastrophic cylinder seal failure leading to sudden loss of pressurized fluid.
- Failure of the machine control system.

Follow the recommendations of the "Piston Rod Selection Chart and Data" in the publication for the series of cylinders of interest. The suggested piston rod diameter in these charts must be followed in order to avoid piston rod buckling.

Piston rods are not normally designed to absorb bending moments or loads which are perpendicular to the axis of piston rod motion. These additional loads can cause the piston rod to fail. If these types of additional loads are expected to be imposed on the piston rod, their magnitude should be made known to our engineering department.

The cylinder user should always make sure that the piston rod is securely attached to the machine member.

On occasion cylinders are ordered with double rods (a piston rod extended from both ends of the cylinder). In some cases a stop is threaded on to one of the piston rods and used as an external stroke adjuster. On occasions spacers are attached to the machine member connected to the piston rod and also used as a stroke adjuster. In both cases the stops will create a pinch point and the user should consider appropriate use of guards. If these external stops are not perpendicular to the mating contact surface, or if debris is trapped between the contact surfaces, a bending moment will be placed on the piston rod, which can lead to piston rod failure. An external stop will also negate the effect of cushioning and will subject the piston rod to impact loading. Those two (2) conditions can cause piston rod failure. Internal stroke adjusters are available with and without cushions. The use of external stroke adjusters should be reviewed with our engineering department.

The piston rod to piston and the stud to piston rod threaded connections are secured with an anaerobic adhesive. The strength of the adhesive decreases with increasing temperature. Cylinders which can be exposed to temperatures above +250°F (+121°C) are to be ordered with a non studded piston rod and a pinned piston to rod joint.

**2.3 Cushions** – Cushions should be considered for cylinder applications when the piston velocity is expected to be over 4 inches/second.

Cylinder cushions are normally designed to absorb the energy of a linear applied load. A rotating mass has considerably more energy than the same mass moving in a linear mode. Cushioning for a rotating mass application should be reviewed by our engineering department.

**2.4 Cylinder Mountings** – Some cylinder mounting configurations may have certain limitations such as but not limited to minimum stroke for side or foot mounting cylinders or pressure de-ratings for certain mounts. Carefully review the catalog for these types of restrictions.

Always mount cylinders using the largest possible high tensile alloy steel socket head cap screws that can fit in the cylinder mounting holes and torque them to the manufacturer's recommendations for their size.

**2.5 Port Fittings** – Hydraulic cylinders applied with meter out or deceleration circuits are subject to intensified pressure at piston rod end.

The rod end pressure is approximately equal to:

$$\frac{\text{operating pressure} \times \text{effective cap end area}}{\text{effective rod end piston area}}$$

Contact your connector supplier for the pressure rating of individual connectors.

**3.0 Cylinder and Accessories Installation and Mounting****3.1 Installation**

**3.1.1** – Cleanliness is an important consideration, and cylinders are shipped with the ports plugged to protect them from contaminants entering the ports. These plugs should not be removed until the piping is to be installed. Before making the connection to the cylinder ports, piping should be thoroughly cleaned to remove all chips or burrs which might have resulted from threading or flaring operations.

**3.1.2** – Cylinders operating in an environment where air drying materials are present such as fast-drying chemicals, paint, or weld splatter, or other hazardous conditions such as excessive heat, should have shields installed to prevent damage to the piston rod and piston rod seals.

**3.1.3** – Proper alignment of the cylinder piston rod and its mating component on the machine should be checked in both the extended and retracted positions. Improper alignment will result in excessive rod bushing and/or cylinder bore wear. On fixed mounting cylinders attaching the piston rod while the rod is retracted will help in achieving proper alignment.

**3.1.4** – Sometimes it may be necessary to rotate the piston rod in order to thread the piston rod into the machine member. This operation must always be done with zero pressure being applied to either side of the piston. Failure to follow this procedure may result in loosening the piston rod. In some rare cases the turning of the piston rod may rotate a threaded piston rod bushing and loosen it from the cylinder head. Confirm that this condition is not occurring. If it does, re-tighten the piston rod bushing firmly against the cylinder head.

For double rod cylinders it is also important that when attaching or detaching the piston rod from the machine member that the torque be applied to the piston rod end of the cylinder that is directly attaching to the machine member with the opposite end unrestrained. If the design of the machine is such that only the rod end of the cylinder opposite to where the rod attaches to the machine member can be rotated, consult the factory for further instructions.

### **3.2 Mounting Recommendations**

**3.2.1** – Always mount cylinders using the largest possible high tensile alloy steel socket head screws that can fit in the cylinder mounting holes and torque them to the manufacturer's recommendations for their size.

**3.2.2** – Side-Mounted Cylinders – In addition to the mounting bolts, cylinders of this type should be equipped with thrust keys or dowel pins located so as to resist the major load.

**3.2.3** – Tie Rod Mounting – Cylinders with tie rod mountings are recommended for applications where mounting space is limited. The standard tie rod extension is shown as BB in dimension tables. Longer or shorter extensions can be supplied. Nuts used for this mounting style should be torqued to the same value as the tie rods for that bore size.

**3.2.4** – Flange Mount Cylinders – The controlled diameter of the rod bushing extension on head end flange mount cylinders can be used as a pilot to locate the cylinders in relation to the machine. After alignment has been obtained, the flanges may be drilled for pins or dowels to prevent shifting.

**3.2.5** – Trunnion Mountings – Cylinders require lubricated bearing blocks with minimum bearing clearances. Bearing blocks should be carefully aligned and rigidly mounted so the trunnions will not be subjected to bending moments. The rod end should also be pivoted with the pivot pin in line and parallel to axis of the trunnion pins.

**3.2.6** – Clevis Mountings – Cylinders should be pivoted at both ends with centerline of pins parallel to each other. After cylinder is mounted, be sure to check to assure that the cylinder is free to swing through its working arc without interference from other machine parts.

### **4.0 Cylinder and Accessories Maintenance, Troubleshooting and Replacement**

**4.1 Storage** – At times cylinders are delivered before a customer is ready to install them and must be stored for a period of time. When storage is required the following procedures are recommended.

**4.1.1** – Store the cylinders in an indoor area which has a dry, clean and noncorrosive atmosphere. Take care to protect the cylinder from both internal corrosion and external damage.

**4.1.2** – Whenever possible cylinders should be stored in a vertical position (piston rod up). This will minimize corrosion due to possible condensation which could occur inside the cylinder. This will also minimize seal damage.

**4.1.3** – Port protector plugs should be left in the cylinder until the time of installation.

**4.1.4** – If a cylinder is stored full of hydraulic fluid, expansion of the fluid due to temperature changes must be considered. Installing a check valve with free flow out of the cylinder is one method.

**4.1.5** – When cylinders are mounted on equipment that is stored outside for extended periods, exposed unpainted surfaces, e.g. piston rod, must be coated with a rust-inhibiting compound to prevent corrosion.

### **4.2 Cylinder Trouble Shooting**

#### **4.2.1 – External Leakage**

**4.2.1.1** – Rod seal leakage can generally be traced to worn or damaged seals. Examine the piston rod for dents, gouges or score

marks, and replace piston rod if surface is rough.

Rod seal leakage could also be traced to bushing wear. If clearance is excessive, replace rod bushing and seal. Rod seal leakage can also be traced to seal deterioration. If seals are soft or gummy or brittle, check compatibility of seal material with lubricant used if air cylinder, or operating fluid if hydraulic cylinder. Replace with seal material, which is compatible with these fluids. If the seals are hard or have lost elasticity, it is usually due to exposure to temperatures in excess of 165°F. (+74°C). Shield the cylinder from the heat source to limit temperature to 350°F. (+177°C.) and replace with fluorocarbon seals.

**4.2.1.2** – Cylinder body seal leak can generally be traced to loose tie rods. Torque the tie rods to manufacturer's recommendation for that bore size.

Excessive pressure can also result in cylinder body seal leak. Determine maximum pressure to rated limits. Replace seals and retorque tie rods as in paragraph above. Excessive pressure can also result in cylinder body seal leak. Determine if the pressure rating of the cylinder has been exceeded. If so, bring the operating pressure down to the rating of the cylinder and have the tie rods replaced.

Pinched or extruded cylinder body seal will also result in a leak. Replace cylinder body seal and retorque as in paragraph above.

Cylinder body seal leakage due to loss of radial squeeze which shows up in the form of flat spots or due to wear on the O.D. or I.D. – Either of these are symptoms of normal wear due to high cycle rate or length of service. Replace seals as per paragraph above.

#### **4.2.2 – Internal Leakage**

**4.2.2.1** – Piston seal leak (by-pass) 1 to 3 cubic inches per minute leakage is considered normal for piston ring construction. Virtually no static leak with lipseal type seals on piston should be expected. Piston seal wear is a usual cause of piston seal leakage. Replace seals as required.

**4.2.2.2** – With lipseal type piston seals excessive back pressure due to over-adjustment of speed control valves could be a direct cause of rapid seal wear. Contamination in a hydraulic system can result in a scored cylinder bore, resulting in rapid seal wear. In either case, replace piston seals as required.

**4.2.2.3** – What appears to be piston seal leak, evidenced by the fact that the cylinder drifts, is not always traceable to the piston. To make sure, it is suggested that one side of the cylinder piston be pressurized and the fluid line at the opposite port be disconnected. Observe leakage. If none is evident, seek the cause of cylinder drift in other component parts in the circuit.

#### **4.2.3 – Cylinder Fails to Move the Load**

**4.2.3.1** – Pneumatic or hydraulic pressure is too low. Check the pressure at the cylinder to make sure it is to circuit requirements.

**4.2.3.2** – Piston Seal Leak – Operate the valve to cycle the cylinder and observe fluid flow at valve exhaust ports at end of cylinder stroke. Replace piston seals if flow is excessive.

**4.2.3.3** – Cylinder is undersized for the load – Replace cylinder with one of a larger bore size.

#### **4.3 Erratic or Chatter Operation**

**4.3.1** – Excessive friction at rod bushing or piston bearing due to load misalignment – Correct cylinder-to-load alignment.

**4.3.2** – Cylinder sized too close to load requirements – Reduce load or install larger cylinder.

**4.3.3** – Erratic operation could be traced to the difference between static and kinetic friction. Install speed control valves to provide a back pressure to control the stroke.

#### **4.4 Cylinder Modifications, Repairs, or Failed Component**

Cylinders as shipped from the factory are not to be disassembled and or modified. If cylinders require modifications, these modifications must be done at company locations or by the Company's certified facilities. The Cylinder Division Engineering Department must be notified in the event of a mechanical fracture or permanent deformation of any cylinder component (excluding seals). This includes a broken piston rod, tie rod, mounting accessory or any other cylinder component. The notification should include all operation and application details. This information will be used to provide an engineered repair that will prevent recurrence of the failure.

It is allowed to disassemble cylinders for the purpose of replacing seals or seal assemblies. However, this work must be done by strictly following all the instructions provided with the seal kits.

**Offer of Sale**

The items described in this document and other documents and descriptions provided by Parker Hannifin Corporation, its subsidiaries and its authorized distributors ("Seller") are hereby offered for sale at prices to be established by Seller. This offer and its acceptance by any customer ("Buyer") shall be governed by all of the following Terms and Conditions. Buyer's order for any item described in its document, when communicated to Seller verbally, or in writing, shall constitute acceptance of this offer. All goods, services or work described will be referred to as "Products".

**1. Terms and Conditions.** Seller's willingness to offer Products, or accept an order for Products, to or from Buyer is subject to these Terms and Conditions or any newer version of the terms and conditions found on-line at [www.parker.com/saleterms/](http://www.parker.com/saleterms/). Seller objects to any contrary or additional terms or conditions of Buyer's order or any other document issued by Buyer.

**2. Price Adjustments; Payments.** Prices stated on Seller's quote or other documentation offered by Seller are valid for 30 days, and do not include any sales, use, or other taxes unless specifically stated. Unless otherwise specified by Seller, all prices are F.C.A. Seller's facility (INCOTERMS 2010). Payment is subject to credit approval and is due 30 days from the date of invoice or such other term as required by Seller's Credit Department, after which Buyer shall pay interest on any unpaid invoices at the rate of 1.5% per month or the maximum allowable rate under applicable law.

**3. Delivery Dates; Title and Risk; Shipment.** All delivery dates are approximate and Seller shall not be responsible for any damages resulting from any delay. Regardless of the manner of shipment, title to any products and risk of loss or damage shall pass to Buyer upon placement of the products with the shipment carrier at Seller's facility. Unless otherwise stated, Seller may exercise its judgment in choosing the carrier and means of delivery. No deferment of shipment at Buyers' request beyond the respective dates indicated will be made except on terms that will indemnify, defend and hold Seller harmless against all loss and additional expense. Buyer shall be responsible for any additional shipping charges incurred by Seller due to Buyer's acts or omissions.

**4. Warranty.** Seller warrants that the Products sold hereunder shall be free from defects in material or workmanship for a period of eighteen months from the date of delivery to Buyer. The prices charged for Seller's products are based upon the exclusive limited warranty stated above, and upon the following disclaimer: **DISCLAIMER OF WARRANTY: THIS WARRANTY COMPRIMES THE SOLE AND ENTIRE WARRANTY PERTAINING TO PRODUCTS PROVIDED HEREUNDER. SELLER DISCLAIMS ALL OTHER WARRANTIES, EXPRESS AND IMPLIED, INCLUDING DESIGN, MERCHANTABILITY AND FITNESS FOR A PARTICULAR PURPOSE.**

**5. Claims; Commencement of Actions.** Buyer shall promptly inspect all Products upon delivery. No claims for shortages will be allowed unless reported to the Seller within 10 days of delivery. No other claims against Seller will be allowed unless asserted in writing within 30 days after delivery. Buyer shall notify Seller of any alleged breach of warranty within 30 days after the date the defect is or should have been discovered by Buyer. Any action based upon breach of this agreement or upon any other claim arising out of this sale (other than an action by Seller for an amount due on any invoice) must be commenced within 12 months from the date of the breach without regard to the date the breach is discovered.

**6. LIMITATION OF LIABILITY.** UPON NOTIFICATION, SELLER WILL, AT ITS OPTION, REPAIR OR REPLACE A DEFECTIVE PRODUCT, OR REFUND THE PURCHASE PRICE. IN NO EVENT SHALL SELLER BE LIABLE TO BUYER FOR ANY SPECIAL, INDIRECT, INCIDENTAL OR CONSEQUENTIAL DAMAGES ARISING OUT OF, OR AS THE RESULT OF, THE SALE, DELIVERY, NON-DELIVERY, SERVICING, USE OR LOSS OF USE OF THE PRODUCTS OR ANY PART THEREOF, OR FOR ANY CHARGES OR EXPENSES OF ANY NATURE INCURRED WITHOUT SELLER'S WRITTEN CONSENT, EVEN IF SELLER HAS BEEN NEGIGENT, WHETHER IN CONTRACT, TORT OR OTHER LEGAL THEORY. IN NO EVENT SHALL SELLER'S LIABILITY UNDER ANY CLAIM MADE BY BUYER EXCEED THE PURCHASE PRICE OF THE PRODUCTS.

**7. User Responsibility.** The user, through its own analysis and testing, is solely responsible for making the final selection of the system and Product and assuring that all performance, endurance, maintenance, safety and warning requirements of the application are met. The user must analyze all aspects of the application and follow applicable industry standards and Product information. If Seller provides Product or system options, the user is responsible for determining that such data and specifications are suitable and sufficient for all applications and reasonably foreseeable uses of the Products or systems.

**8. Loss to Buyer's Property.** Any designs, tools, patterns, materials, drawings, confidential information or equipment furnished by Buyer or any other items which become Buyer's property, will be considered obsolete and may be destroyed by Seller after two consecutive years have elapsed without Buyer ordering the items manufactured using such property. Seller shall not be responsible for any loss or damage to such property while it is in Seller's possession or control.

**9. Special Tooling.** A tooling charge may be imposed for any special tooling, including without limitation, dies, fixtures, molds and patterns, acquired to manufacture Products. Such special tooling shall be and remain Seller's property notwithstanding payment of any charges by Buyer. In no event will Buyer acquire any interest in apparatus belonging to Seller which is utilized in the manufacture of the Products, even if such apparatus has been specially converted or adapted for such manufacture and notwithstanding any charges paid by Buyer. Unless otherwise agreed, Seller shall have the right to alter, discard or otherwise dispose of any special tooling or other property in its sole discretion at any time.

**10. Buyer's Obligation; Rights of Seller.** To secure payment of all sums due or otherwise, Seller shall retain a security interest in the goods delivered and this agreement shall be deemed a Security Agreement under the Uniform Commercial Code. Buyer authorizes Seller as its attorney to execute and file on Buyer's behalf all documents Seller deems necessary to perfect its security interest.

**11. Improper use and Indemnity.** Buyer shall indemnify, defend, and hold Seller harmless from any claim, liability, damages, lawsuits, and costs (including attorney fees), whether for personal injury, property damage, patent, trademark or copyright

infringement or any other claim, brought by or incurred by Buyer, Buyer's employees, or any other person, arising out of: (a) improper selection, improper application or other misuse of Products purchased by Buyer from Seller; (b) any act or omission, negligent or otherwise, of Buyer; (c) Seller's use of patterns, plans, drawings, or specifications furnished by Buyer to manufacture Product; or (d) Buyer's failure to comply with these terms and conditions. Seller shall not indemnify Buyer under any circumstance except as otherwise provided.

**12. Cancellations and Changes.** Orders shall not be subject to cancellation or change by Buyer for any reason, except with Seller's written consent and upon terms that will indemnify, defend and hold Seller harmless against all direct, incidental and consequential loss or damage. Seller may change product features, specifications, designs and availability with notice to Buyer.

**13. Limitation on Assignment.** Buyer may not assign its rights or obligations under this agreement without the prior written consent of Seller.

**14. Force Majeure.** Seller does not assume the risk and shall not be liable for delay or failure to perform any of Seller's obligations by reason of circumstances beyond the reasonable control of Seller (hereinafter "Events of Force Majeure"). Events of Force Majeure shall include without limitation: accidents, strikes or labor disputes, acts of any government or government agency, acts of nature, delays or failures in delivery from carriers or suppliers, shortages of materials, or any other cause beyond Seller's reasonable control.

**15. Waiver and Severability.** Failure to enforce any provision of this agreement will not waive that provision nor will any such failure prejudice Seller's right to enforce that provision in the future. Invalidation of any provision of this agreement by legislation or other rule of law shall not invalidate any other provision herein. The remaining provisions of this agreement will remain in full force and effect.

**16. Termination.** Seller may terminate this agreement for any reason and at any time by giving Buyer thirty (30) days written notice of termination. Seller may immediately terminate this agreement, in writing, if Buyer: (a) commits a breach of any provision of this agreement (b) appoints a trustee, receiver or custodian for all or any part of Buyer's property (c) files a petition for relief in bankruptcy on its own behalf, or by a third party (d) makes an assignment for the benefit of creditors, or (e) dissolves or liquidates all or a majority of its assets.

**17. Governing Law.** This agreement and the sale and delivery of all Products hereunder shall be deemed to have taken place in and shall be governed and construed in accordance with the laws of the State of Ohio, as applicable to contracts executed and wholly performed therein and without regard to conflicts of laws principles. Buyer irrevocably agrees and consents to the exclusive jurisdiction and venue of the courts of Cuyahoga County, Ohio with respect to any dispute, controversy or claim arising out of or relating to this agreement.

**18. Indemnity for Infringement of Intellectual Property Rights.** Seller shall have no liability for infringement of any patents, trademarks, copyrights, trade dress, trade secrets or similar rights except as provided in this Section. Seller will defend and indemnify Buyer against allegations of infringement of U.S. patents, U.S. trademarks, copyrights, trade dress and trade secrets ("Intellectual Property Rights"). Seller will defend at its expense and will pay the cost of any settlement or damages awarded in an action brought against Buyer based on an allegation that a Product sold pursuant to this Agreement infringes the Intellectual Property Rights of a third party. Seller's obligation to defend and indemnify Buyer is contingent on Buyer notifying Seller within ten (10) days after Buyer becomes aware of such allegations of infringement, and Seller having sole control over the defense of any allegations or actions including all negotiations for settlement or compromise. If a Product is subject to a claim that it infringes the Intellectual Property Rights of a third party, Seller may, at its sole expense and option, procure for Buyer the right to continue using the Product, replace or modify the Product so as to make it noninfringing, or offer to accept return of the Product and return the purchase price less a reasonable allowance for depreciation. Notwithstanding the foregoing, Seller shall have no liability for claims of infringement based on information provided by Buyer, or directed to Products delivered hereunder for which the designs are specified in whole or part by Buyer, or infringements resulting from the modification, combination or use in a system of any Product sold hereunder. The foregoing provisions of this Section shall constitute Seller's sole and exclusive liability and Buyer's sole and exclusive remedy for infringement of Intellectual Property Rights.

**19. Entire Agreement.** This agreement contains the entire agreement between the Buyer and Seller and constitutes the final, complete and exclusive expression of the terms of sale. All prior or contemporaneous written or oral agreements or negotiations with respect to the subject matter are herein merged.

**20. Compliance with Law, U.K. Bribery Act and U.S. Foreign Corrupt Practices Act.** Buyer agrees to comply with all applicable laws and regulations, including both those of the United Kingdom and the United States of America, and of the country or countries of the Territory in which Buyer may operate, including without limitation the U. K. Bribery Act, the U.S. Foreign Corrupt Practices Act ("FCPA") and the U.S. Anti-Kickback Act (the "Anti-Kickback Act"), and agrees to indemnify and hold harmless Seller from the consequences of any violation of such provisions by Buyer, its employees or agents. Buyer acknowledges that they are familiar with the provisions of the U. K. Bribery Act, the FCPA and the Anti-Kickback Act, and certifies that Buyer will adhere to the requirements thereof. In particular, Buyer represents and agrees that Buyer shall not make any payment or give anything of value, directly or indirectly to any governmental official, any foreign political party or official thereof, any candidate for foreign political office, or any commercial entity or person, for the purpose of influencing such person to purchase products or otherwise benefit the business of Seller.

# Custom Modifications Engineered to Order

***exclusively for Atlas H Series cylinders***

Looking for an NFPA Interchangeable  
non Tie Rod Cylinder?

***Consider a H B modification***

- Easier to service
- Offers a clean appearance
- Improves aesthetics particularly in longer stroke applications

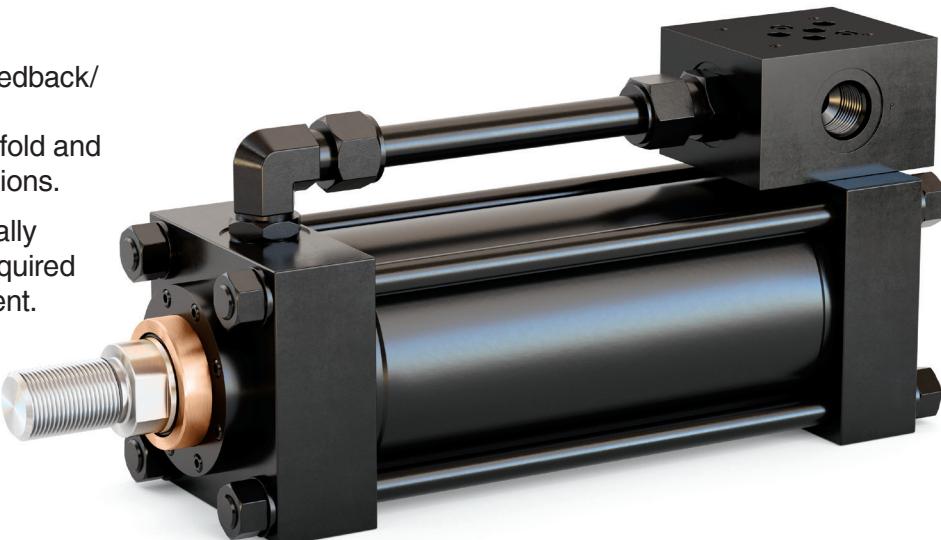

Looking to cleanly integrate your H into  
your Electrohydraulic system?

***Consider a H X modification***

Engineered for your feedback/  
control systems with  
transducer, valve manifold and  
hydraulic plumbing options.

All units are electronically  
tested to verify your required  
outputs prior to shipment.

**Consult your local Atlas representative today**

All specifications and information subject to  
change without notice or prior obligation.
